

M62032FP

VOLTAGE DETECTING, SYSTEM RESETTING IC

GENERAL DESCRIPTION

The M62032FP is an IC for detection of two different input voltages to reset almost all logic circuits including MCU. It contains a delay circuit with which any delay time can be obtained only by adding an external capacitor. The IC is widely applicable to a battery check circuit, a level detection circuit, a waveform shaping circuit, etc.

FEATURES

- A small number of external components
- Built-in 2 input voltage detection circuits
- Wide supply voltage range 2 to 10V
- Small 8-pin package
- Open collector output

APPLICATION

Reset circuit of MPU, MCU and logics
