

1-OF-10 DECODER WITH 3-STATE OUTPUTS

The MC54/74F537 is a one-of-ten decoder/demultiplexer with four active HIGH BCD inputs and ten mutually exclusive outputs. A polarity control input determines whether the outputs are active LOW or active HIGH. The MC54/74F537 has 3-state outputs, and a HIGH signal on the Output Enable (\overline{OE}) input forces all outputs to the high impedance state. Two input enables, active HIGH E_2 and active LOW \overline{E}_1 , are available for demultiplexing data to the selected output in either non-inverted or inverted form. Input codes greater than BCD nine cause all outputs to go to the inactive state (i.e., same polarity as the P input).

- Demultiplexing Capability
- 3-State Outputs
- Multiple Input Enable for Expansion
- Polarity Control Input
- ESD Protection > 4000 Volts
