CURRENT MODE PWM CONTROL CIRCUITS

DESCRIPTION

The UTC UC3842A/3843A provide the necessary functions to implement off-line or DC to DC fixed frequency current mode , controlled switching circuits with a minimal external part count

FEATURES

- *Low external part count.
- *Low start up current (Typical 0.12mA)
- *Automatic feed forward compensation
- *Pulse-by-Pulse current limiting
- *Under-voltage lockout with hysteresis
- *Double pulse Suppression
- *High current totem pole output to drive MOSFET directly
- *Internally trimmed band gap reference
- *500kHz operation

note 4: Gain defined as:

$$A = \frac{\Delta V_{pin\ 1}}{\Delta V_{pin\ 3}} ; 0 \leq V_{pin\ 3} \leq 0.8V$$

note 5: Adjust V_{cc} above the start threshold before setting at 15V.

OPEN-LOOP LABORATORY TEST FIXTURE

High peak current associated with capacity loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in single point GND. The transistor and 5kΩ potentiometer are used to sample the oscillator waveform and apply an adjustable Ramp to Pin 3.

UNDER-VOLTAGE LOCKOUT

During Under-Voltage Lockout, the output driver is biased to a high impedance state. Pin 6 should be shunt to GND with a bleeder resistor to prevent activating the power switch with output leakage currents.

ERROR AMPLIFIER CONFIGURATION

Error amplifier can source or sink up to 0.5mA

CURRENT SENSE CIRCUIT

SLOPE COMPENSATION

A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converters requiring duty cycles over 50%. Note that capacitor C forms a filter with R_2 to suppress the leading edge switch spikes.

SHUTDOWN TECHNIQUES

Shutdown UTC UC3842A can be accomplished by two methods; either raise pin 3 above 1V or pull Pin 1 below a voltage two diode drops above ground. Either method caused the output of PWM comparator to be high(refer to block diagram).The PWM latch is reset dominant so that the output will remain low until the next clock cycle after the shutdown condition at pins 1 and/or 3 is removed . In one example, an externally latched shut -down may be accomplished by adding an SCR which be reset by cycling Vcc below the lower UVLO threshold. At this point the reference turns off allowing the SCR to reset.
