

**DDR SDRAM Module 256Mbyte (32Mx64bit), based on 32Mx8, 4Banks,
8K Ref., SMM,
Part No. HDD32M64F8**

GENERAL DESCRIPTION

The HANBit HDD32M64F8 is 32M bit x 64 Double Data Rate SDRAM high density memory modules. The HANBit HDD32M64F8 consists of eight CMOS 32M x 8 bit with 4banks Double Data Rate SDRAMs in 66pin TSOP-II(400mil) packages mounted on a 200pin glass-epoxy substrate. Four 0.1uF decoupling capacitors are mounted on the printed circuit board in parallel for each DDR SDRAM. The HDD32M64F8 is Dual In-line Memory Modules and inten-ded for mounting into 200pin edge connector sockets.

Synchronous design allows precise cycle control with the use of system clock. Data I/O transactions are possible on both edges of DQS. Range of operating frequencies, programmable latencies and burst lengths allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

FEATURES

- Part Identification

HDD32M64F8 – 10A : 100MHz (CL=2)

HDD32M64F8 – 13A : 133MHz (CL=2)

HDD32M64F8 – 13B : 133MHz (CL=2.5)

- Power supply : V_{DD} : 2.5V \pm 0.2V, V_{DDQ} : 2.5V \pm 0.2V
- Double-data-rate architecture; two data transfers per clock cycle
- Bidirectional data strobe(DQS)
- Differential clock inputs(CK and CK)
- DLL aligns DQ and DQS transition with CK transition
- Programmable Read latency 2, 2.5 (clock)
- Programmable Burst length (2, 4, 8)
- Programmable Burst type (sequential & interleave)
- Edge aligned data output, center aligned data input
- Auto & Self refresh, 7.8us refresh interval(8K/64ms refresh)
- Serial presence detect with EEPROM

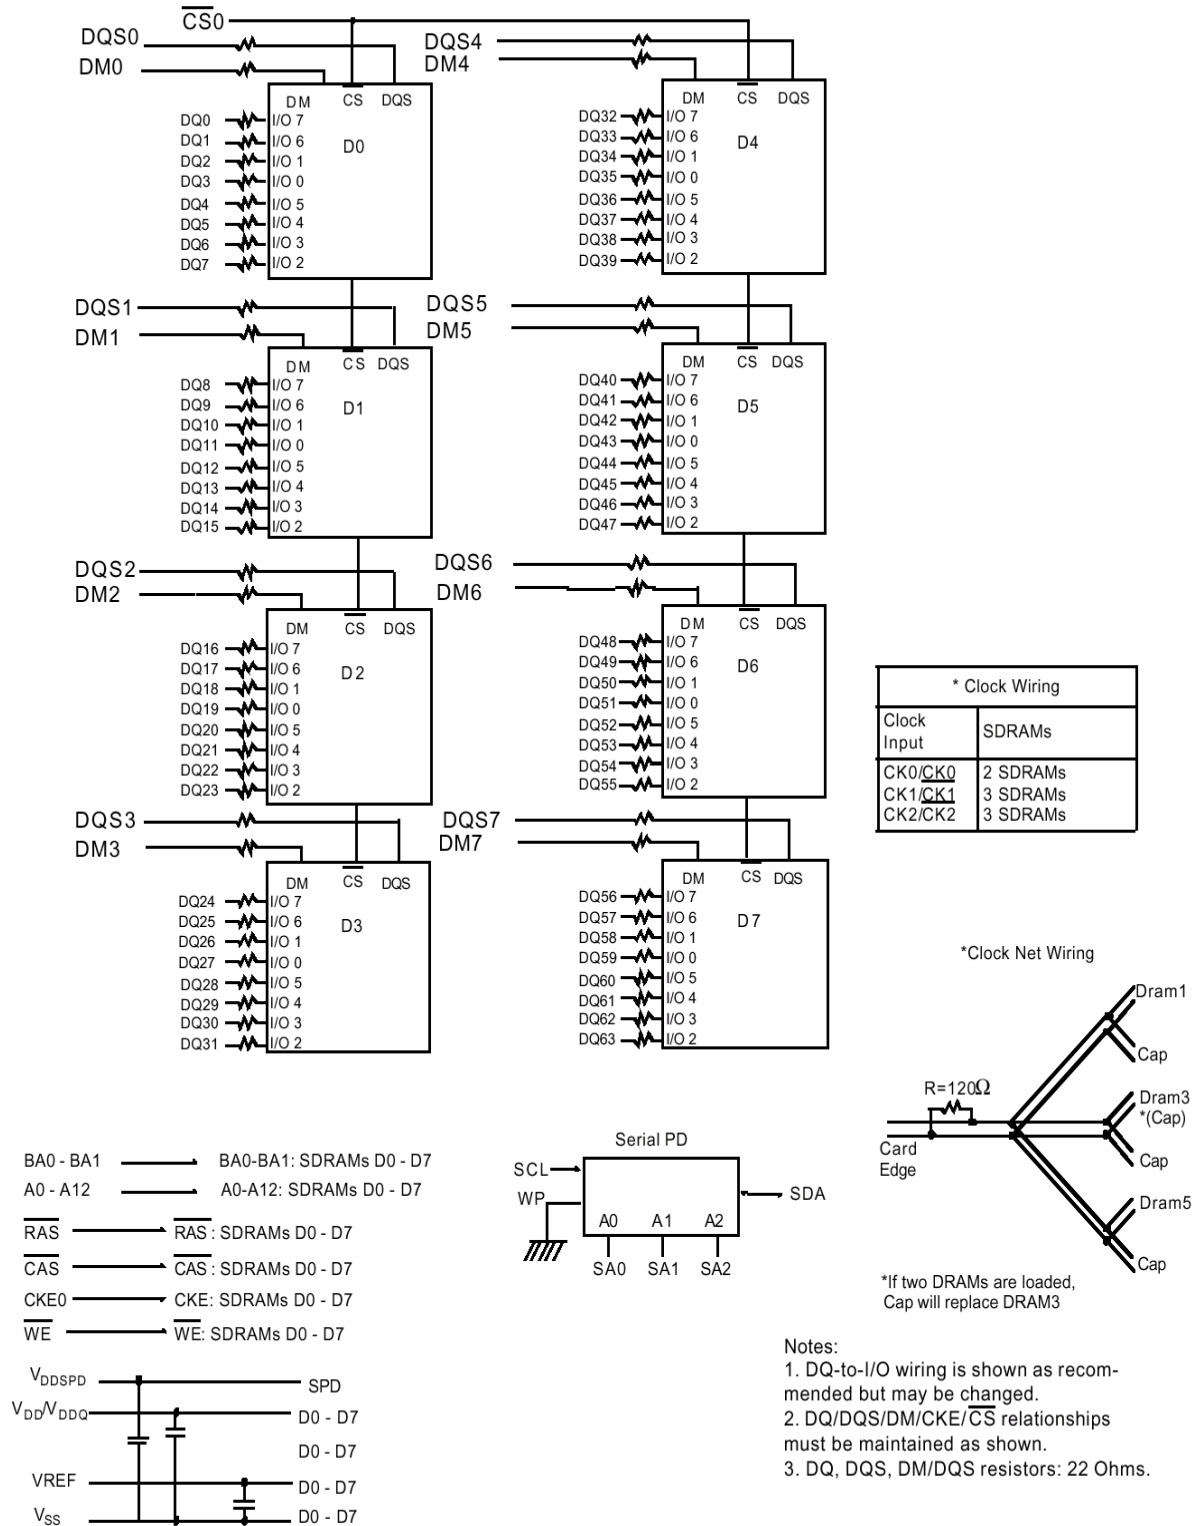

PIN ASSIGNMENT

* These pins should be NC in the system which does not support SPD

PIN	PIN DESCRIPTION	PIN	PIN DESCRIPTION
A0~A12	Address input	VDD	Power supply(2.5V)
BA0~BA1	Bank Select Address	VDDQ	Power supply for DQs(2.5V)
DQ0~DQ63	Data input/output	VREF	Power supply for reference
CB0~CB7	Check bit(Data input/output)	VSPD	Serial EEPROM Power supply(3.3)
DQS0~DQS7	Data Strobe input/output	VSS	Ground
DM0~DM7	Data-in Mask	SA0~SA2	Address in EEPROM
CK0~CK2,/CK0~/CK2	Clock input	SDA	Serial data I/O
CKE0	Clock enable input	SCL	Serial clock
/CS0	Chip Select input	WP	Write protection
/RAS	Row Address strobe	VDDIN	VDD identification flag
/CAS	Column Address strobe	NC	No connection

FUNCTIONAL BLOCK DIAGRAM

PIN FUNCTION DESCRIPTION

Pin	Name	Input Function
CK, /CK	Clock	CK and /CK are differential clock inputs. All address and control input signals are sampled on the positive edge of CK and negative edge of CK. Output (read) data is referenced to both edges of CK. Internal clock signals are derived from CK/CK.
CKE	Clock Enable	CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER-DOWN(row ACTIVE in any bank). CKE is synchronous for all functions except for disabling outputs, which is achieved asynchronously. Input buffers, excluding CK, CK and CKE are disabled during power-down and self refresh modes, providing low standby power. CKE will recognizean LVCMOS LOW level prior to VREF being stable on power-up.
/CS	Chip Select	/CS enables(registered LOW) and disables(registered HIGH) the command decoder. All commands are masked when /CS is registered HIGH. /CS provides for external bank selection on systems with multiple banks. /CS is considered part of the command code.
A0 ~ A12	Address	Row/column addresses are multiplexed on the same pins. Row address : RA0 ~ RA12, Column address : CA0 ~ CA9
BA0 ~ BA1	Bank select address	BA0 and BA1 define to which bank an ACTIVE, READ, WRITE or PRE-CHARGE command is being applied.
/RAS	Row address strobe	Latches row addresses on the positive going edge of the CLK with /RAS low. Enables row access & precharge.
/CAS	Columnaddress strobe	Latches column addresses on the positive going edge of the CLK with /CAS low. Enables column access.
/WE	Write enable	Enables write operation and row precharge. Latches data in starting from /CAS, /WE active.
DQS0 ~ 7	Data Strobe	Output with read data, input with write data. Edge-aligned with read data, centered in write data. Used to capture write data.
DM0~7	Input Data Mask	DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with that input data during a WRITE access. DM is sampled on both edges of DQS. DM pins include dummy loading internally, to matches the DQ and DQS load-ing.
DQ0 ~ 63	Data input/output	Data inputs/outputs are multiplexed on the same pins.
WP	Write Protection	WP pin is connected to Vcc. When WP is "high", EEPROM Programming will be inhibited and the entire memory will be write-protected.
VDDQ	Supply	DQ Power Supply : +2.5V ± 0.2V.
VDD	Supply	Power Supply : +2.5V ± 0.2V (device specific).
VSS	Supply	DQ Ground.
VREF	Supply	SSTL_2 reference voltage.

ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	RATING	UNTE
Voltage on any pin relative to Vss	V_{IN}, V_{OUT}	-0.5 ~ 3.6	V
Voltage on V_{DD} supply relative to Vss	V_{DD}	-1.0 ~ 3.6	V
Voltage on V_{DDQ} supply relative to Vss	V_{DDQ}	-0.5 ~ 3.6	V
Storage temperature	T_{STG}	-55 ~ +150	°C
Power dissipation	P_D	8.0	W
Short circuit current	I_{OS}	50	mA

Notes: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.

Functional operation should be restricted to recommended operating condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

POWER & DC OPERATING CONDITIONS

(Recommended operating conditions (Voltage referenced to $V_{SS} = 0V$, $T_A = 0$ to $70^\circ C$))

PARAMETER	SYMBOL	MIN	MAX	UNIT	NOTE
Supply Voltage	V_{DD}	2.3	2.7	V	
I/O Supply Voltage	V_{DDQ}	2.3	2.7	V	
I/O Reference Voltage	V_{REF}	$V_{DDQ}/2-50mV$	$V_{DDQ}/2+50mV$	V	1
I/O Termination Voltage(system)	V_{TT}	$V_{REF} - 0.04$	$V_{REF} + 0.04$	V	2
Input High Voltage	$V_{IH} (DC)$	$V_{REF} + 0.15$	$V_{REF} + 0.3$	V	
Input Low Voltage	$V_{IL} (DC)$	-0.3	$V_{REF} - 0.15$	V	
Input Voltage Level, CK and /CK inputs	$V_{IN} (DC)$	-0.3	$V_{DDQ} + 0.3$	V	
Input Differential Voltage, CK and /CK inputs	$V_{ID} (DC)$	0.3	$V_{DDQ} + 0.6$	V	
Input leakage current	I_{LI}	-2	2	uA	3
Output leakage current	I_{OZ}	-5	5	uA	
Output High current ($V_{OUT} = 1.95V$)	I_{OH}	-16.8		mA	
Output Low current ($V_{OUT} = 0.35V$)	I_{OL}	16.8		mA	
Output High Current(Half strength driver)	I_{OH}	-9		mA	
Output High Current(Half strength driver)	I_{OL}	9		mA	

Notes

1. Includes $\pm 25mV$ margin for DC offset on V_{REF} , and a combined total of $\pm 50mV$ margin for all AC noise and DC offset on V_{REF} , bandwidth limited to 20MHz. The DRAM must accommodate DRAM current spikes on V_{REF} and internal DRAM noise coupled TO V_{REF} , both of which may result in V_{REF} noise. V_{REF} should be de-coupled with an inductance of $\leq 3nH$.

2. V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} , and must track variations in the DC level of V_{REF} .

3. V_{ID} is the magnitude of the difference between the input level on CK and the input level on /CK.

4. These parameters should be tested at the pin on actual components and may be checked at either the pin or the pad in simulation. The AC and DC input specifications are relative to a V_{REF} envelop that has been bandwidth limited to 200MHZ.

5. The value of V_{IX} is expected to equal $0.5 \cdot V_{DDQ}$ of the transmitting device and must track variations in the dc level of the same.

6. These characteristics obey the SSTL-2 class II standards.

INPUT/OUTPUT CAPACITANCE ($V_{DD} = 2.5V, V_{DDQ} = 2.5V, T_A = 25^\circ C, f = 1MHz$)

DESCRIPTION	SYMBOL	MIN	MAX	UNITS
Input Capacitance(A0 ~ A12, BA0 ~ BA1,RAS,CAS, WE)	C_{IN1}	49	57	pF
Input Capacitance(CKE0)	C_{IN2}	42	50	pF
Input Capacitance(CS0)	C_{IN3}	42	50	pF
Input Capacitance(CLK0, CLK1,CLK2)	C_{IN4}	22	25	pF
Data & DQS input/output Capacitance(DQ0~DQ63)	C_{OUT1}	6	8	pF
Input Capacitance(DM0~DM8)	C_{IN5}	6	8	pF

AC OPERATING CONDITIONS

PARAMETER/ CONDITION	STMBOL	MIN	MAX	UNIT	NOTE
Input High (Logic 1) Voltage, DQ, DQS and DM signals	$V_{IH} (AC)$	$V_{REF} + 0.31$			3
Input Low (Logic 0) Voltage, DQ, DQS and DM signals.	$V_{IL} (AC)$		$V_{REF} - 0.31$	V	3
Input Differential Voltage, CK and CK inputs	$V_{ID} (AC)$	0.7	$V_{DDQ} + 0.6$	V	1
Input Crossing Point Voltage, CK and CK inputs	$V_{IX} (AC)$	$0.5 * V_{DDQ} - 0.2$	$0.5 * V_{DDQ} + 0.2$	V	2

- Note** 1. V_{ID} is the magnitude of the difference between the input level on CK and the input on CK.
 2. The value of V_{IX} is expected to equal $0.5 * V_{DDQ}$ of the transmitting device and must track variations in the DC level of the same.
 3. These parameters should be tested at the pim on actual components and may be checked at either the pin or the pad in simulation.
 the AC and DC input specificatims are reflation to a V_{REF} envelope that has been bandwidth limited 20MHz.

AC OPERATING TEST CONDITIONS

PARAMETER	VALUE	UNIT	NOTE
Input reference voltage for Clock	$0.5 * V_{DDQ}$	V	
Input signal maximum peak swing	1.5	V	
Input signal minimum slew rate	0.5	V/ns	
Input Levels(V_{IH}/V_{IL})	$V_{REF} + 0.31 / V_{REF} - 0.31$	V	
Input timing measurement reference level	V_{REF}	V	
Output timing measurement reference level	V_{TT}	V	
Output load condition	See Load Circuit	V	

Output Load Circuit (SSTL_2)

DQS write postamble time	t_{WPST}	0.25		0.25		0.25		t_{CK}	4

Notes :

- Maximum burst refresh cycle : 8
- The specific requirement is that DQS be valid(High or Low) on or before this CK edge. The case shown(DQS going from High_Z to logic Low) applies when no writes were previously in progress on the bus. If a previous write was in progress, DQS could be High at this time, depending on t_{DQSS} .
- The maximum limit for this parameter is not a device limit. The device will operate with a great value for this parameter, but system performance (bus turnaround) will degrade accordingly.
- A write command can be applied with t_{RCD} satisfied after this command.
- For registered DIMMs, t_{CL} and t_{CH} are $\geq 45\%$ of the period including both the half period jitter ($t_{JIT}(HP)$) of the PLL and the half jitter due to crosstalk ($t_{JIT}(crosstalk)$) on the DIMM.

6. Input Setup/Hold Slew Rate Derating

Input Setup/Hold Slew Rate	Δt_{IS}	Δt_{IH}
(V/ns)	(ps)	(ps)
0.5	0	0
0.4	+50	+50
0.3	+100	+100

This derating table is used to increase t_{DS}/t_{DH} in the case where the input slew rate is below 0.5V/ns. Input setup/hold slew rate based on the lesser of AC-AC slew rate and DC-DC slew rate.

7. I/O Setup/Hold Slew Rate Derating

Input Setup/Hold Slew Rate	Δt_{IS}	Δt_{IH}
(V/ns)	(ps)	(ps)
0.5	0	0
0.4	+75	+75
0.3	+150	+150

This derating table is used to increase t_{DS}/t_{DH} in the case where the I/O slew rate is below 0.5V/ns. I/O setup/hold slew rate based on the lesser of AC-AC slew rate and DC-DC slew rate.

8. I/O Setup/Hold Plateau Derating

I/O Input Level	Δt_{DS}	Δt_{DH}
(mV)	(ps)	(ps)
± 280	+50	+50

This derating table is used to increase t_{DS}/t_{DH} in the case where the input level is flat below $V_{REF} \pm 310mV$ for a duration of up to 2ns.

9. I/O Delta Rise/Fall Rate(1/slew-rate) Derating

Delta Rise/Fall Rate	Δt_{DS}	Δt_{DH}
(ns/V)	(ps)	(ps)
0	0	0
± 0.25	+50	+50
± 0.5	+100	+100

This derating table is used to increase t_{DS}/t_{DH} in the case where the DQ and DQS slew rates differ. The Delta Rise/Fall Rate is calated as $1/SlewRate1-1/SlewRate2$. For example, if slew rate 1 = 5V/ns and slew rate 2 = .4V/ns then the Delta Rise/Fall

Rate = -0/5ns/V. Input S/H slew rate based on larger of AC-AC delta rise/fall rate and DC-DC delta rise/fall rate.

10. This parameter is fir system simulation purpose. It is guranteed by design.

11. For each of the terms, if not already an integer, round to the next highest integer. t_{CK} is actual to the system clock cycle time.

COMMAND TRUTH TABLE (V=VALID, X=DOV ϕ T CARE, H=LOGIC HIGH, L=LOGIC LOW)

						L	V	V				V		
DM		H	X					V	X		8			
No operation command		H	X	H	X	X	X	X	X					
				L	H	H	H							

Note :

- OP Code : Operand Code. A0 ~ A12 & BA0 ~ BA1 : Program keys. (@EMRS/MRS)
- EMRS/ MRS can be issued only at all banks precharge state.
A new command can be issued 2 clock cycles after EMRS or MRS.
- Auto refresh functions are same as the CBR refresh of DRAM.
The automatical precharge without row precharge command is meant by "Auto".
Auto/self refresh can be issued only at all banks precharge state.
- BA0 ~ BA1 : Bank select addresses.
If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.
If BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank B is selected.
If BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank C is selected.
If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.
- If A10/AP is "High" at row precharge, BA0 and BA1 are ignored and all banks are selected.
- During burst write with auto precharge, new read/write command can not be issued.
Another bank read/write command can be issued after the end of burst.
New row active of the associated bank can be issued at tRP after the end of burst.
- Burst stop command is valid at every burst length.
- DM sampled at the rising and falling edges of the DQS and Data-in are masked at the both edges (Write DM latency is 0).
- This combination is not defined for any function, which means "No Operation(NOP)" in DDR SDRAM.
