

AM Amplifier for French Sound IF Standard

TDA 2148

Bipolar IC

Controlled AM IF amplifier with quasi-synchronous demodulator and integral mean value control for French sound IF applications.

Features

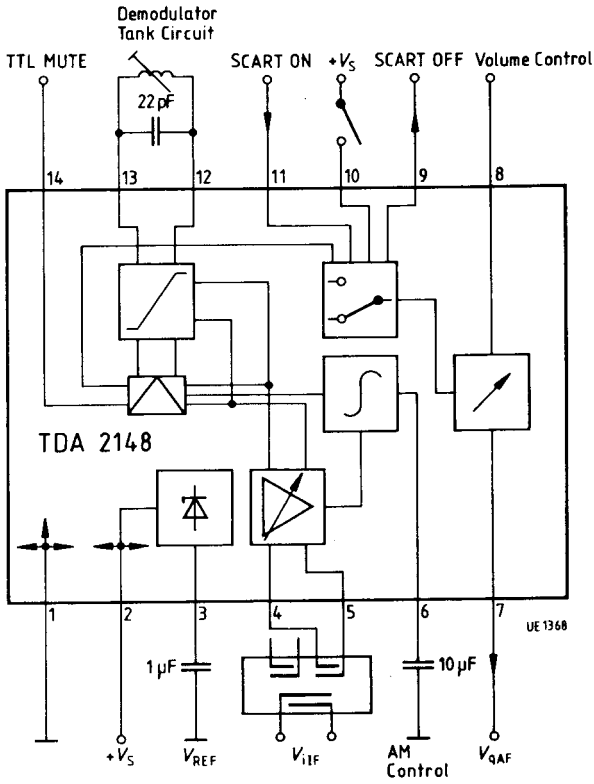

- High input sensitivity
- Few external components
- Low distortion
- Full SCART interface
- Partially compatible with TDA 2460

Type	Ordering Code	Package
TDA 2148	Q67000-A2476	P-DIP-14

Circuit Description

The component contains a four-stage, capacitatively coupled control amplifier and a quasi-synchronous demodulator according to the French sound IF standard. The control voltage is generated by means of an integral mean value control. The resulting AF signal is pre-amplified and routed to the SCART output as well as to the record / playback switch. This is followed by a volume control with a low-impedance AF output.

Simplified External Circuitry for the TDA 2148 Demodulator Circuit

The TDA 2148 AM (double side-band) demodulator circuit allows simplified external circuitry.

The new sound demodulator circuit, developed for application in television L standard and multistandard sets, provides the user with the following advantages:

Cost savings by not requiring the carrier select circuit (L, C) and the necessary tuning (time).

The circuit that is part of the carrier generation circuit, becomes unnecessary because of the excellent capture ratio features of the limiter.

Capture ratio defines the ability of a limiter amplifier, to distinguish a useable signal from an interference signal with a lower amplitude.

In this specific section, the modulation side-bands represent the interference signal and the carrier the useable signal (desired switching carrier).

Even with a 100% modulation (France 80%) the distance from the side-bands to the carrier is 6 dB.

The system guarantees secure function. This is also shown by measurements with respect to:

- harmonic distortion
- noise
- signal/noise ratio

in a comparison with/without regenerative circuit. Only the control threshold shifts by 2 dB.
