

Features

- Single power supply voltage of 2.7V to 3.6V
- Power down features using CE1# and CE2
- Low operating current : 30mA(max for 55 ns)
- Maximum Standby current : 10 μ A at 3.6 V
- Data retention supply voltage: 1.5V to 3.6V
- Direct TTL compatibility for all input and output
- Wide operating temperature range: -40°C to 85°C
- Package type: 48-ball TFBGA, 6x8mm

circuit technology provides both high speed and low power. It is automatically placed in low-power mode when chip enable (CE1#) is asserted high or (CE2) is asserted low. There are three control inputs. CE1# and CE2 are used to select the device and for data retention control, and output enable (OE#) provides fast memory access. Data byte control pin (LB#,UB#) provides lower and upper byte access. This device is well suited to various microprocessor system applications where high speed, low power and battery backup are required. And, with a guaranteed operating range from -40°C to 85°C, the EM562161 can be used in environments exhibiting extreme temperature conditions.

- Input pulse level : 0.4V, 2.4V
- Timing measurements : 0.5 x VDD
- t_R, t_F : 5ns

Read Cycle (See Note 1)

Write Cycle 2 (CE1# Controlled)(See Note 4)

Write Cycle 3 (CE2 Controlled)(See Note 4)

Write Cycle4

(UB#, LB# Controlled)(See Note 4)

Note:

1. WE# remains HIGH for the read cycle.
2. If CE1# goes LOW (or CE2 goes HIGH) with or after WE# goes LOW, the outputs will remain at high impedance.
3. If CE1# goes HIGH (or CE2 goes LOW) coincident with or before WE# goes HIGH, the outputs will remain at high impedance.
4. If OE# is HIGH during the write cycle, the outputs will remain at high impedance.
5. Because I/O signals may be in the output state at this time, input signals of reverse polarity must not be applied.
