

XE88LC01 Sensing Machine

16 + 10 bit Data Acquisition

Ultra Low-Power Microcontroller

General Description

The XE88LC01 is an ultra low-power microcontroller unit (MCU) associated with a versatile analog-to-digital converter (ADC) including a programmable offset and gain pre-amplifier (PGA).

XE88LC01 is available with on chip Multiple-Time-Programmable (MTP) Flash program memory and ROM.

Applications

- Internet connected appliances
- Portable, battery operated instruments
- Piezoresistive bridge sensors
- HVAC control
- Motor control

Key product Features

- Low-power, high resolution ZoomingADC
 - 0.5 to 1000 gain with offset cancellation
 - up to 16 bits ADC
 - up to 13 input multiplexer
- Low-voltage low-power controller operation
 - 2 MIPS at 2.4 V to 5.5 V supply voltage
 - 300 µA at 1 MIPS, 2.4 V to 5.5 V supply
- 22 kByte (8 kInstruction) MTP, 520 Byte RAM
- RC and crystal oscillators
- 5 reset, 18 interrupt, 8 event sources
- 100 years MTP Flash retention at 55°C

Ordering Information

Reference	Memory type	Temperature	Package
XE88LC01MI000	MTP Flash	-40°C to 85°C	die
XE88LC01MI027	MTP Flash	-40°C to 85°C	LQFP44
XE88LC01MI032	MTP Flash	-40°C to 85°C	PLL-44L
XE88LC01RI000	ROM	-40°C to 125°C	die
XE88LC01RI027	ROM	-40°C to 125°C	LQFP44

1 Detailed Pin Description

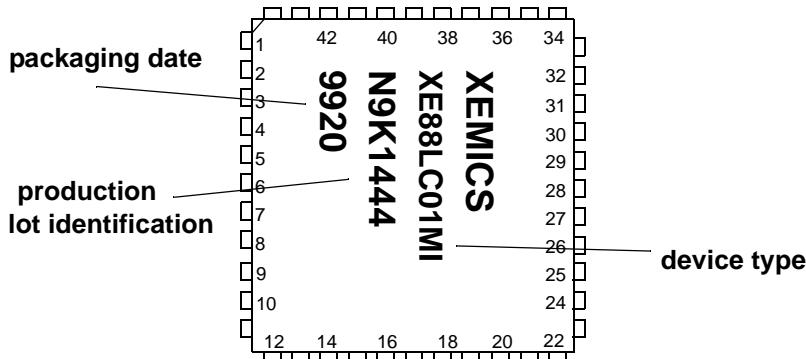

Figure 1.1: Pinout of the XE88LC01 in LQFP44 package

Pin				Description
Position in TQFP44	Function name	Second function name	Type	
1	PA(5)		Input	Input of Port A
2	PA(6)		Input	Input of Port A
3	PA(7)		Input	Input of Port A
4	PC(0)		Input/Output	Input-Output of Port C
5	PC(1)		Input/Output	Input-Output of Port C
6	PC(2)		Input/Output	Input-Output of Port C
7	PC(3)		Input/Output	Input-Output of Port C
8	PC(4)		Input/Output	Input-Output of Port C
9	PC(5)		Input/Output	Input-Output of Port C
10	PC(6)		Input/Output	Input-Output of Port C
11	PC(7)		Input/Output	Input-Output of Port C
12	PB(0)	testout	Input/Output/Analog	Input-Output-Analog of Port B/ Data output for test and MTP programing/ PWM output
13	PB(1)		Input/Output/Analog	Input-Output-Analog of Port B/ PWM output
14	PB(2)		Input/Output/Analog	Input-Output-Analog of Port B
15	PB(3)	SOU	Input/Output/Analog	Input-Output-Analog of Port B, Output pin of USRT
16	PB(4)	SCL	Input/Output/Analog	Input-Output-Analog of Port B/ Clock pin of USRT
17	PB(5)	SIN	Input/Output/Analog	Input-Output-Analog of Port B/ Data input or input-output pin of USRT
18	PB(6)	Tx	Input/Output/Analog	Input-Output-Analog of Port B/ Emission pin of UART
19	PB(7)	Rx	Input/Output/Analog	Input-Output-Analog of Port B/ Reception pin of UART
20	VPP/TEST	Vhigh	Special	Test mode/High voltage for MTP programing
21	AC_R(3)		Analog	Highest potential node for 2nd reference of ADC
22	AC_R(2)		Analog	Lowest potential node for 2nd reference of ADC
23	AC_A(7)		Analog	ADC input node
24	AC_A(6)		Analog	ADC input node
25	AC_A(5)		Analog	ADC input node
26	AC_A(4)		Analog	ADC input node

Table 1.1: Pin-out of the XE88LC01 in LQFP44
 (see Table “IO pins performances” on page 18 for drive capabilities of the pins)

Pin				Description
Position in TQFP44	Function name	Second function name	Type	
27	AC_A(3)		Analog	ADC input node
28	AC_A(2)		Analog	ADC input node
29	AC_A(1)		Analog	ADC input node
30	AC_A(0)		Analog	ADC input node
31	AC_R(1)		Analog	Highest potential node for 1st reference of ADC
32	AC_R(0)		Analog	Lowest potential node for 1st reference of ADC
33	VSS		Power	Negative power supply, connected to substrate
34	Vbat		Power	Positive power supply
35	Vreg		Analog	Regulated supply
36	RESET		Input	Reset pin (active high)
37	Vmult		Analog	Pad for optional voltage multiplier capacitor
38	OscIn	ck_cr	Analog/Input	Connection to Xtal/ CoolRISC clock for test and MTP programing
39	OscOut	ptck	Analog/Input	Connection to Xtal/ Peripheral clock for test and MTP programing
40	PA(0)	testin	Input	Input of Port A/ Data input for test and MTP programing/ Counter A input
41	PA(1)	testck	Input	Input of Port A/ Data clock for test and MTP programing/ Counter B input
42	PA(2)		Input	Input of Port A/ Counter C input/ Counter capture input
43	PA(3)		Input	Input of Port A/ Counter D input/ Counter capture input
44	PA(4)		Input	Input of Port A

Table 1.1:

Pin-out of the XE88LC01 in LQFP44

(see Table “IO pins performances” on page 18 for drive capabilities of the pins)

2 Absolute maximum ratings

Stresses beyond these listed in this chapter may cause permanent damage to the device. No functional operation is implied at or beyond these conditions. Exposure to these conditions for an extended period may affect the device reliability.

Parameter	Valéue
VBAT with respect to VSS	-0.3V to 6.0V
Input voltage on any input pin	VSS-0.3V to VBAT+0.3V
Storage temperature	-55°C to 125°C
Storage temperature for programmed MTP devices	-40°C to 85°C

Table 2.1: Absolute maximum ratings

These devices are ESD sensitive. Although these devices feature proprietary ESD protection structures, permanent damage may occur on devices subjected to high energy electrostatic discharges. Proper ESD precautions have to be taken to avoid performance degradation or loss of functionality.

3 Electrical Characteristics

All specification are -40°C to 85°C unless otherwise noted. ROM operates up to 125°C.

Operation conditions		min	typ	max	Unit	Remarks
Power supply	ROM version	2.4		5.5	V	
	MTP version	2.4		5.5	V	
Operating speed	2.4 V to 5.5 V	0.032		2	MHz	
Instruction cycle	any instruction	500		ns		7
Current requirement	CPU running at 1 MIPS			310	uA	1
	CPU running at 32 kHz on Xtal, RC off			10	uA	1
	CPU halt, timer on Xtal, RC off			1	uA	1
	CPU halt, timer on Xtal, RC ready			1.7	uA	1
	CPU halt, Xtal off timer on RC at 100 kHz			1.4	uA	1
Current requirement	CPU halt, ADC 16 bits at 4 kHz		190		uA	4,6
	CPU halt, ADC 12 bits at 4 kHz, PGA gain 100		460		uA	4,6
	CPU at 1 MIPS, ADC 12 bits at 4 kHz		670		uA	3,4,6
	CPU at 1 MIPS, ADC 12 bits at 4 kHz, PGA gain 10		790		uA	3,4,6
	CPU at 1 MIPS, ADC 12 bits at 4 kHz, PGA gain 100		940		uA	3,4,6
	CPU at 1 MIPS, ADC 12 bits at 4 kHz, PGA gain 1000		1100		uA	3,4,6
	Voltage level detection			15	uA	
MTP Flash memory	Prog. voltage	10.3		10.8	V	
	Erase time	0.2		1	s	8
	Write/Erase cycles	10	100			5
	Data retention	10			years	85°C, 2
		100			years	55°C, 2

Table 3.1: Specifications and current requirement of the XE88LC01

Note:

- 1) Power supply: 2.4 V - 5.5 V, temperature is 27°C.
- 2) < 10 erase cycles.
- 3) Output not loaded.
- 4) Current requirement can be divided by a factor of 2 or 4 by reducing the speed accordingly.
- 5) More cycles possible during development, with restraint retention
- 6) Power supply: 3.0V, at 27°C; see chapter Power Consumption on page 30 for variation of current with voltage and clock speed variation
- 7) With 2 MHz clock, all instructions are using exactly 1 clock cycle
- 8) Longer erase time may degrade retention

4 CPU

The XE88LC01 CPU is a low power RISC core. It has 16 internal registers for efficient implementation of the C compiler. Its instruction set is made of 35 generic instructions, all coded on 22 bits, with 8 addressing modes. All instructions are executed in one clock cycle, including conditional jumps and 8x8 multiplication.

A complete tool suite for development is available from XEMICS, including programmer, C-compiler, assembler, simulator, linker, all integrated in a modern and efficient graphical user interface.

5 Memory organisation

The CPU uses a Harvard architecture, so that memory is organised in two separated fields: program memory and data memory. As both memory are separated, the central processing unit can read/write data at the same time it loads an instruction. Peripherals and system control registers are mapped on data memory space.

Program memory is fitted onto one page. Data is made of several 256 bytes pages.

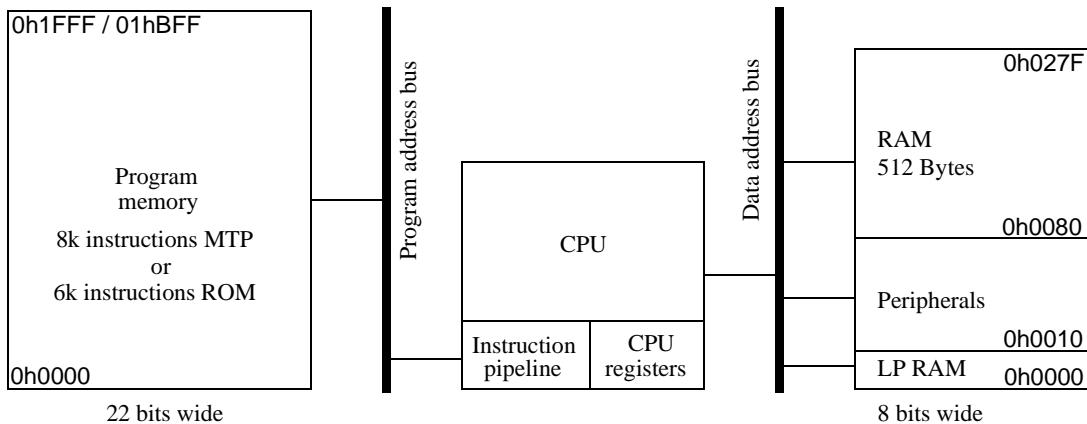

Figure 5.1: Memory organization

5.1 Program memory

The program memory is implemented as Multiple Time Programmable (MTP) Flash memory. The power consumption of MTP memory is linear with the access frequency (no significant static current).

Size of the MTP Flash memory is 8192 x 22 bits (= 22 kBytes)

Size of the ROM memory is 6144 x 22 bits (= 17 kBytes)

block	size	address
MTP	8192 x 22	H0000 - H1FFF
ROM	6144 x 22	H0000 - H1BFF

Table 5.1: Program addresses for MTP or ROM memory

5.2 Data memory

The data memory is implemented as static Random-Access Memory (RAM). The RAM size is 512 x 8 bits plus 8 low power RAM bytes that require very low current when addressed. Programs using the low-power RAM instead of RAM will use even less current.

block	size	address
LP RAM	8 x 8	H0000 - H0007
RAM	512 x 8	H0080 - H027F

Table 5.2: RAM addresses

6 Registers list

Left column include register name and address.

Right columns include bit name, access (r: read, r0: always 0 when read, w: write, c: cleared by writing any value, c1: cleared by writing 1), and reset status (0 or 1) and signal. Empty bits are reserved for future use and should not be written, neither should their read value be used for any purpose as it may change without notice.

6.1 Peripherals mapping

block	size	address	Page
LP RAM	8x8	H0000-H0007	
System control	16x8	H0010-H001F

7 Peripherals

The XE88LC01 includes usual microcontroller peripherals and some other blocks more specific to low-voltage or mixed-signal operation. They are 3 parallel ports, one input port (A), one IO and analog port (B) with analog switching capabilities and one general purpose IO port (C). A watchdog is available, connected to a prescaler. Four 8-bit counters, with capture, PWM and chaining capabilities are available. The UART can handle transmission speeds as high as 115kbaud.

Low-power low-voltage blocks include a voltage level detector, two oscillators (one internal 0.1-2 MHz RC oscillator and a 32 kHz crystal oscillator) and a specific regulation scheme that largely uncouples current requirement from external power supply (usual CMOS ASICs require much more current at 5.5 V than they need at 2.4 V. This is not the case for the XE88LC01).

Analog blocks (ZoomingADC (acquisition path)) are defined below. All these blocks operate on 2.4 - 5.5 V power supply range.

7.1 Counters

- 4 8-bit counters
- Daisy chain on 16 bits
- PWM on 8-16 bits
- Capture - compare on 16 bits
- Events and interrupts generation

7.2 Prescaler

- Interrupt generated with 1 second period for ultra low power hibernation mode

7.3 Watchdog

- 2 seconds watchdog

7.4 UART

- full duplex operation with buffered receiver and transmitter.
- Internal baudrate generator with programmable baudrate (300 - 115000 bauds).
- 7 or 8 bits word length.
- even, odd, or no-parity bit generation and detection
- 1 stop bit
- error receive detection : Start, Parity, Frame and Overrun
- receiver echo mode
- 2 interrupts (receive full and transmit empty)
- enable receive and/or transmit
- invert pad Rx and/or Tx

7.5 Xtal clock

The Xtal Oscillator operates with an external crystal of 32'768 Hz.

symbol	description	min	typ	max	unit	comments
f_clk32k	nominal frequency		32768		Hz	
st_x32k	oscillator start-up time		1	2	s	for full precision
duty_clk32k	duty cycle on the digital output	30	50	70	%	
fstab_1	relative frequency deviation from nominal, for a crystal with CL=8.2 pF and temperature between -40° and +85°C	-100		+300	ppm	not included: crystal frequency tolerance and aging crystal frequency - temperature dependence

Table 7.1: Xtal oscillator specifications.

Note:

Board layout recommendations for safer crystal oscillation and lower current consumption:
 Keep lines xtal_in and xtal_out short and insert a VSS line between them.
 Connect package of the crystal to VSS.
 No noisy or digital lines near xtal_in and xtal_out.
 Insert guards at VSS where needed.

7.6 RC oscillator

The RC Oscillator is always turned on at power-on reset and can be turned off after the optional Xtal oscillator has been started. The RC oscillator has two frequency ranges: sub-MHz (100KHz to 1MHz) and above-MHz (1MHz to max MCU frequency). Inside a range, the frequency can be tuned by software for coarse and fine adjustment.

Note:

No external component is required for the RC oscillator.

The RC oscillator can be in 3 modes. In mode 1(RC on), the RC oscillator and its bias are on. In mode 2 (RC ready), the RC oscillator is off and the bias is on. In mode 3 (RC off), the RC oscillator and the bias are off. RC ready mode is a compromise between power consumption and start-up time.

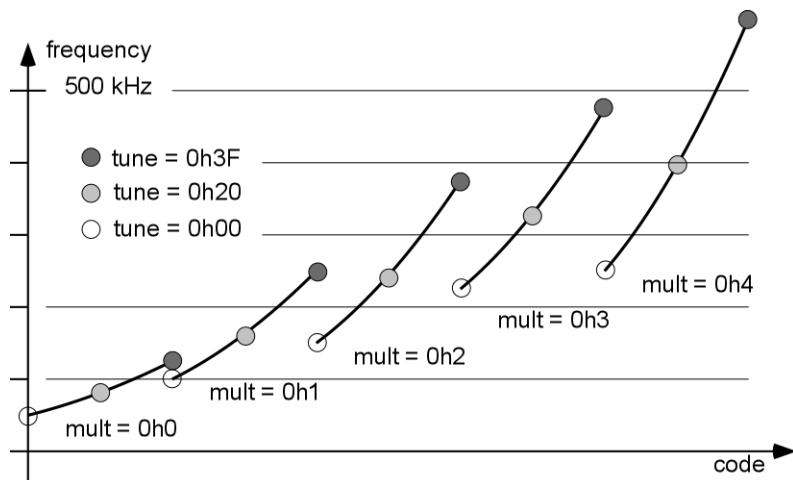

Figure 7.1: RC frequencies programming example for low range (typical values)

symbol	description	min	typ	max	unit	comments
F_{st}	frequency at start-up	50	80	110	kHz	
range	range selection	1		10		multiplies F_{st}
mult[3:0]	coarse tuning range	1		16		4 bits, multiplies $F_{st} * range$

Table 7.3: IO pins performances

7.8 Voltage level detector

- Can be switched off, on or simultaneously with CPU activities
- Generates an interrupt if power supply is below a pre-determined level

The Voltage Level Detector monitors the state of the system battery. It returns a logical high value (an interrupt) in the status register if the supplied voltage drops below the user defined level.

symbol	description	min	typ	max	unit	comments

Table 7.4: Voltage level detector operation

Note:

- 1) Absolute precision of the threshold voltage is $\pm 10\%$.
- 2) This timing is respected in case the internal RC or crystal oscillators are selected. Refer to the clock block documentation in case the external clock is used.

8 ZoomingADC

The fully differential acquisition chain is formed of a programmable gain (0.5 - 1000) and offset amplifier and a programmable speed and resolution ADC (example: 12 bits at 4 kHz, 16 bits at 1 kHz). It can handle inputs with very low full scale signal and large offsets.

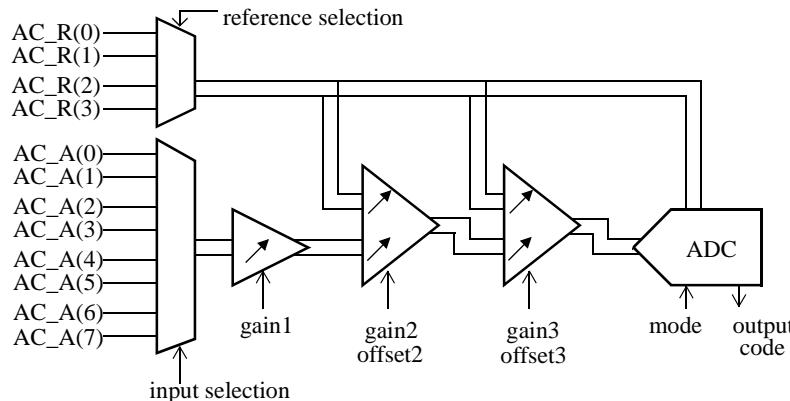

Figure 8.1: Acquisition channel block diagram

Input selection is made from 1 of 4 differential pairs or 1 of seven single signal versus AC_A(0). Reference is chosen from the 2 differential references. Acquisition path offset can be suppressed by inverting input polarity.

The gain of each amplifier is programmed individually. Each amplifier is powered on and off on command to minimize the total current requirement. All blocks can be set to low frequency operation and lower their current requirement by a factor 2 or 4.

The ADC can run continuously (end of conversion signalled by an interrupt, event or by polling the ready bit), or it can be started on request.

8.1 PGA 1

symbol	description	min	typ	max	unit	Comments
GD1	PGA1 Signal Gain	1		10	-	GD1 = 1 or 10
GD_preci	Precision on gain settings	-5		+5	%	
GD_TC	Temperature dependency of gain settings	-5		+5	ppm/°C	
fs	input sampling frequency			512	kHz	
Zin1	Input impedance	150			kΩ	1
Zin1p	Input impedance for gain 1	1500			kΩ	1
VN1	Input referred noise		28.6		nV/sqrt(Hz)	2

Table 8.1: PGA1 Performances

Note:

- 1) Measured with block connected to inputs through AMUX block. Normalized input sampling frequency for input impedance is 512 kHz. This figure has to be multiplied by 2 for fs = 256 kHz and 4 for fs = 128 kHz.
- 2) Input referred rms noise is 205 uV per input sample with gain = 1, 20.5 uV with gain = 10. This corresponds to 28.6 nV/sqrt(Hz) for fs = 512 kHz and gain = 10.

8.2 PGA2

sym	description	min	typ	max	unit	Comments
GD2	PGA2 Signal Gain	1		10	-	GD2 = 1, 2, 5 or 10
GDoff2	PGA2 Offset Gain	-1		1	FS

GD_preci	Precision on gain settings	-5		+5	%	valid for GD3 and GDoff3
GD_TC	Temperature dependency of gain settings	-5		+5	ppm/°C	
fs	Input sampling frequency			512	kHz	
Zin3	Input impedance	150			kΩ	1
VN3	Input referred noise			51.0	nV/sqrt(Hz)	2

Table 8.3: PGA3 Performances

Note:

- 1) Measured with block connected to inputs through AMUX block. Normalized input sampling frequency for input impedance is 512 kHz. This figure has to be multiplied by 2 for fs = 256 kHz and 4 for fs = 128 kHz.
- 2) Input referred rms noise is 365 uV per imput sample with gain = 1, 36.5 uV with gain = 10. This corresponds to 51.0 nV/sqrt(Hz) for fs = 512 kHz.

8.4 Analog to digital converter (ADC)

The whole analog to digital conversion sequence is basically made of an initialisation, a set of Nelconv elementary incremental conversions and finally a termination phase (N_{umConv} is set by 2 bits on **RegACCfg0**). The result is a mean of the results of the elementary conversions.

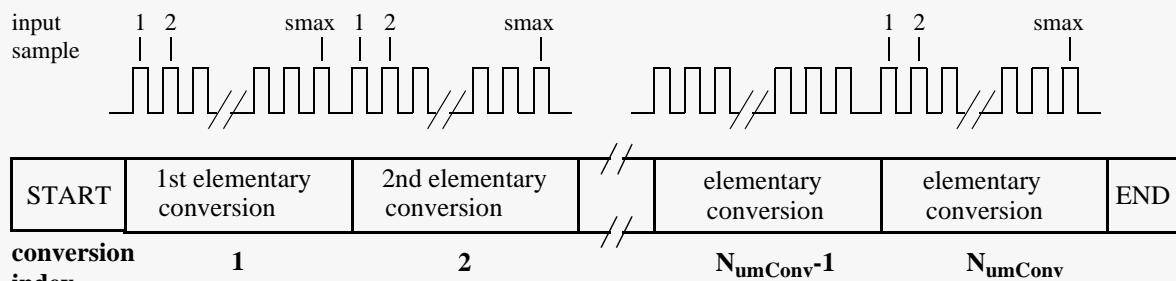

Figure 8.2: Conversion sequence. $smax$ is the oversampling rate.

Note: N_{umConv} elementary conversions are performed, each elementary conversion being made of $smax$ input samples.

$$N_{umConv} = 2^{NELCONV}$$

$$smax = 8 * 2^{OSR}$$

During the elementary conversions, the operation of the converter is the same as in a sigma delta modulator. During one conversion sequence, the elementary conversions are alternatively performed with direct and crossed PGA-ADC differential inputs, so that when two elementary conversions or more are performed, the offset of the converter is cancelled.

Some additional clock cycles ($N_{INIT} + N_{END}$) clock cycles are used to initiate and terminate the conversion properly.

8.5 ADC performances

sym	description	min	typ	max	unit	Comments
VINR	Input range	-0.5		0.5	Vref	
Resol	Resolution	6		16	bits	
NResol	Numerical resolution			16	bits	3
DNL	Differential non-linearity	-0.1		0.1	LSB	LSB at 16 bits
INL	Integral non-linearity	-3		2	LSB	2, LSB at 16 bits
fs	sampling frequency	10		512	kHz	
smax	Oversampling Ratio	8		1024	-	1
N_{umConv}	Number of elementary conversions in incremental mode	1		8	-	1
Ninit	Number of periods for incremental conversion initialization			5	-	
Nend	Number of periods for incremental conversion termination			5	-	

Table 8.4: ADC Performances

Note: 1) Only powers of 2

Note: 2) INL is defined as the deviation of the DC transfer curve from the best fit straight line. This specifici-

cation holds over 100% of the full scale.

3) NResol is the maximal readable resolution of the digital filter.

8.6

resolution	conditions	input frequency.	conversion time.	output frequency.
6	oversampling per conversion = 8 1 conversion (no offset rejection)	512 kHz	40 us	25 kHz
8	oversampling per conversion = 16 1 conversion (no offset rejection)	512 kHz	50 us	20 kHz
12	oversampling per conversion = 64 1 conversion (no offset rejection)	512 kHz	150 us	6.7 kHz
13	oversampling per conversion = 64 2 conversions (offset rejection)	512 kHz	275 us	3.6 kHz
16	oversampling per conversion = 256 1 conversion (no offset rejection)	512 kHz	500 us	2 kHz
16	oversampling per conversion = 256 2 conversions (offset rejection)	512 kHz	1 ms	1 kHz
16	oversampling per conversion = 1024 8 conversions (offset rejection)	512 kHz	16.5 ms	60 Hz

Table 8.5: ADC performances examples

8.7 Linearity

To quantify linearity errors, Integral Non-Linearity (INL) and Differential Non-Linearity (DNL) were measured for the ADC alone and for gains of 1, 5, 10, 20, 100, 1000, and a resolution of 12 bits and 16 bits.

INL is defined as the deviation (in LSB) of the DC transfer curve of each individual code from the best-fit straight line. This specification holds over the full scale.

DNL is defined as the difference (in LSB) between the ideal (1 LSB) and measured code transitions for successive codes. INL and DNL are specified after gain and offset errors have been removed.

The gain settings of each PGA stage for the plots of above figure are those of the table below.

PGA Gain GD _{TOT} (V/V)	PGA1 Gain GD1 (V/V)	PGA2 Gain GD2 (V/V)	PGA3 Gain GD3 (V/V)
1	1	bypassed	bypassed
5	1	5	bypassed
10	10	bypassed	bypassed
20	10	2	bypassed
100	10	10	bypassed
1000	10	10	10

Table 8.6: Individual PGA gains for INL & DNL measurements

Table 8.7:

8.10 Noise

Ideally, a constant input voltage V_{IN} should result in a constant output code. However, because of circuit noise, the output code may vary for a fixed input voltage. The figure shows the distribution for the ADC alone (PGA1, 2, and 3 bypassed) and of several configurations of the PGAs. Quantization noise is dominant in this case of ADC only, and, thus, the ADC thermal noise is negligible.

One has to consider two points when computing final noise of the acquisition chain:

- this is a type of amplifier (switched-cap with constant capacitive load) that maintains its output noise when changing the gain. Therefore input referred noise is lowered when the gain of an amplifier is increased.
- the ADC is oversampled, and the number of samples taken lowers the thermal noise

Total input referred noise can be computed using the following equation:

$$V_{n,in}^2 = \frac{\left(\frac{V_{n,out1}}{gain1}\right)^2 + \left(\frac{V_{n,out2}}{gain1 \cdot gain2}\right)^2 + \left(\frac{V_{n,out3}}{gain1 \cdot gain2 \cdot gain3}\right)^2}{numconv \cdot smax}$$

Where $V_{n,outx}$ is the rms output noise of amplifier x.

Amplifier	Symbol	Typical output noise per over-sample	Unit
PGA1	$V_{n,out1}$	205	uVrms
PGA2	$V_{n,out2}$	340	uVrms
PGA3	$V_{n,out3}$	365	uVrms

Typical output noise of ZoomingADC preamplifiers

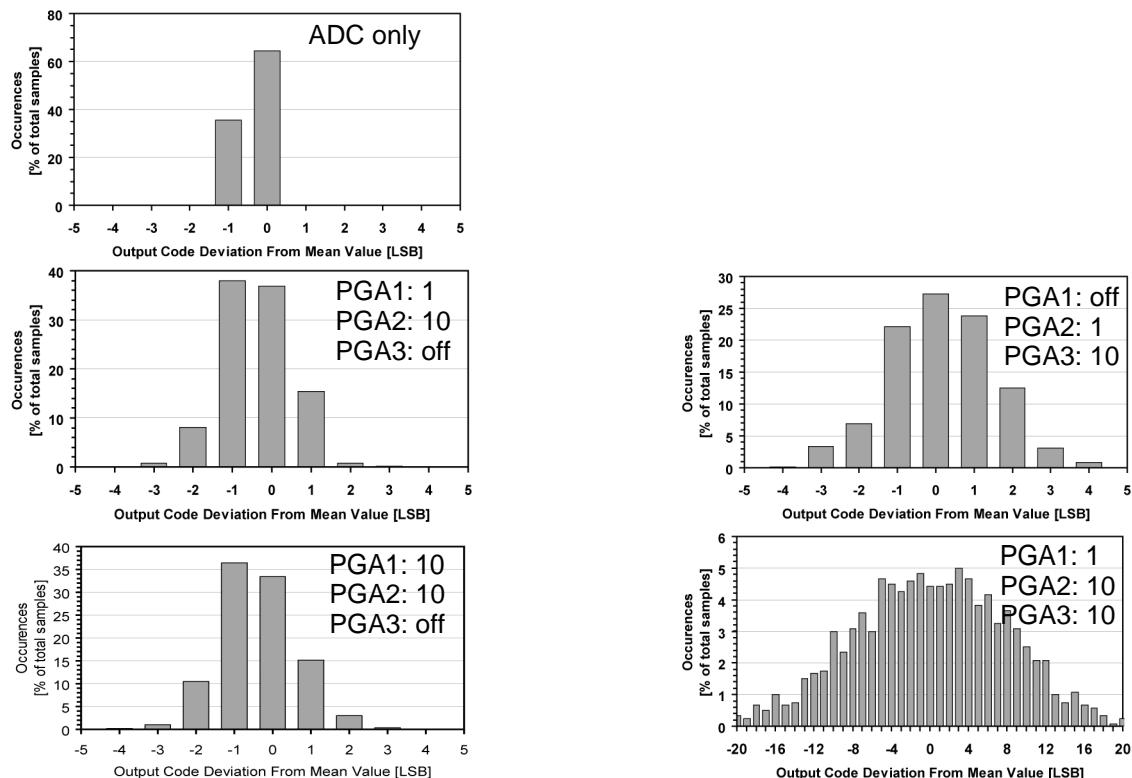

Figure 8.17: Noise measured at the output of the ZoomingADC

As one can see on the figures above, increase the gain of the first amplifier lowers the output noise for constant global gain. It also lowers sensitivity to temperature drift as offset is better compensated on first amplifier.

8.11 Gain Error and Offset Error

Gain error is defined as the amount of deviation between the ideal transfer function and the measured transfer function (with the offset error removed). The left figure shows gain error vs. temperature for different PGA gains. The curves are expressed in % of Full-Scale Range (FSR) normalized to 25°C.

Offset error is defined as the output code error for a zero volt input (ideally, output code = 0). The measured offset errors vs. temperature curves for different PGA gains are depicted in the right figure below. The output offset error, expressed in (LSB), is normalized to 25°C.

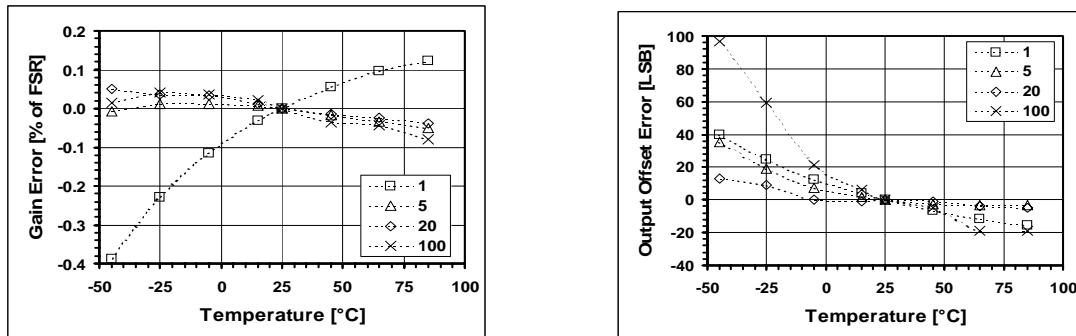

Figure 8.18: Gain and offset error vs temperature for several gains, normalized to 25°C, offset cancellation disabled. When the offset cancellation is enabled, the offset remains below the LSB in all temperature situations.

8.12 Power Consumption

Left figure below plots the variation of quiescent current consumption with supply voltage V_{DD} , as well as the distribution between the 3 PGA stages and the ADC. As shown in the right figure, quiescent current consumption is not greatly affected by sampling frequency. It can be seen that the quiescent current varies by about 20% between 100kHz and 2MHz. Quiescent current consumption vs. temperature is shown in the second set of figures, showing a relative increase of nearly 40% between -45 and +85°C.

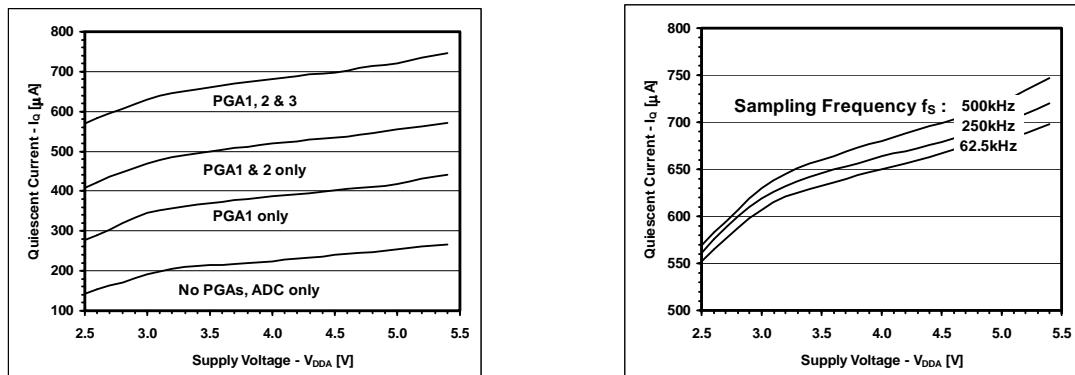

Figure 8.19: Quiescent current versus supply voltage for different gains and clock speed (not using the PGA and ADC low power modes)

Supply	ADC	PGA1	PGA2	PGA3	TOTAL	Unit
$V_{DD} = 5V$	250	165	130	175	720	μA
$V_{DD} = 3V$	190	150	120	160	620	μA

Table 8.8: Typical quiescent current distributions in acquisition chain ($n = 16$ bits, $f_S = 500\text{kHz}$)

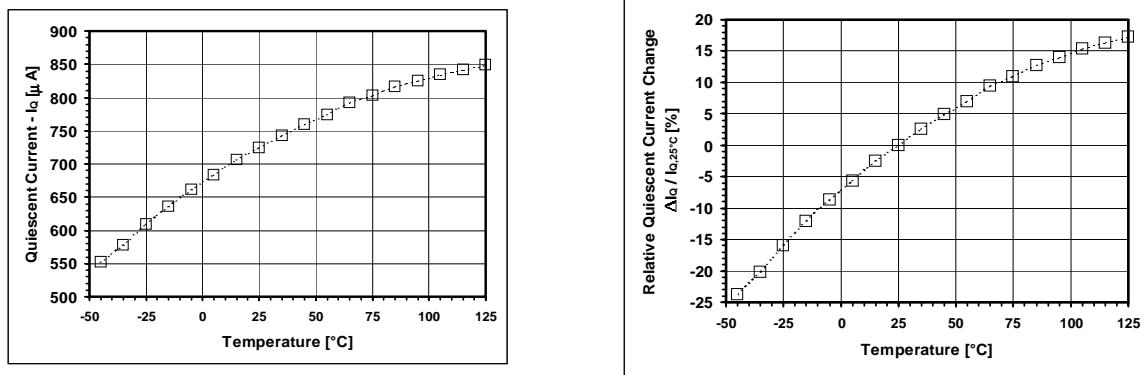

Figure 8.20: Absolute and (b) relative change in quiescent current consumption vs. temperature

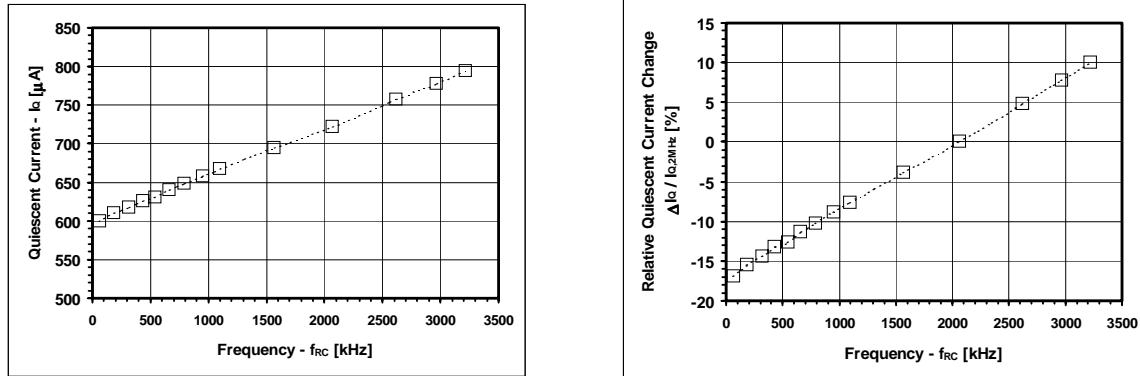

Figure 8.21: Absolute and (b) relative change in quiescent current consumption vs. clock speed

8.13 Power Supply Rejection Ratio

Figure below shows power supply rejection ratio (PSRR) at 3V and 5V supply voltage, and for various PGA gains. PSRR is defined as the ratio (in dB) of voltage supply change (in V) to the change in the converter output (in V). PSRR depends on both PGA gain and supply voltage V_{DD} .

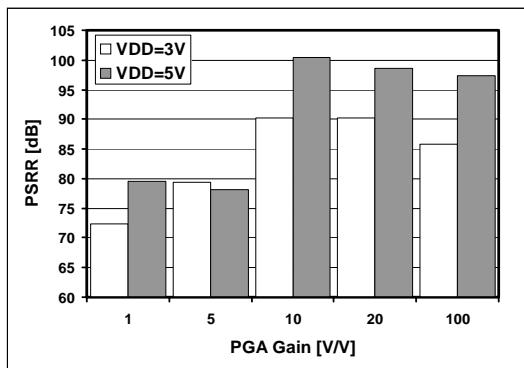

Figure 8.22: Power supply rejection ratio (PSRR)

Supply	GAIN = 1	GAIN = 5	GAIN = 10	GAIN = 20	GAIN = 100	Unit
V _{DD} = 5V	79	78	100	99	97	dB
V _{DD} = 3V	72	79	90	90	86	dB

Table 8.9: PSRR ($n = 16$ bits, $V_{IN} = V_{REF} = 2.5V$, $f_S = 500kHz$)

8.14 Frequency Response

The incremental ADC of the XE88LC01 is an over-sampled converter with two main blocks: an analog modulator and a low-pass digital filter. The main function of the digital filter is to remove the quantization noise introduced by the modulator. As shown below, this filter determines the frequency response of the transfer function between the output of the ADC and the analog input V_{IN} . Notice that the frequency axes are normalized to one elementary conversion period OSR/f_S . The plots below also show that the frequency response changes with the number of elementary conversions N_{ELCONV} performed. In particular, notches appear for $N_{ELCONV} \geq 2$. These notches occur at:

$$f_{NOTCH}(i) = \frac{i \cdot f_S}{OSR \cdot N_{ELCONV}} \text{ (Hz) for } i = 1, 2, \dots, (N_{ELCONV} - 1)$$

and are repeated every f_S/OSR .

Information on the location of these notches is particularly useful when specific frequencies must be filtered out by the acquisition system. For example, consider a 5Hz-bandwidth, 16-bit sensing system where 50Hz line rejection is needed. Using the above equation and the plots below, we set the 4th notch for $N_{ELCONV} = 4$ to 50Hz, i.e. $1.25 \cdot f_S/OSR = 50\text{Hz}$. The sampling frequency is then calculated as $f_S = 20.48\text{kHz}$ for $OSR = 512$. Notice that this choice yields also good attenuation of 50Hz harmonics.

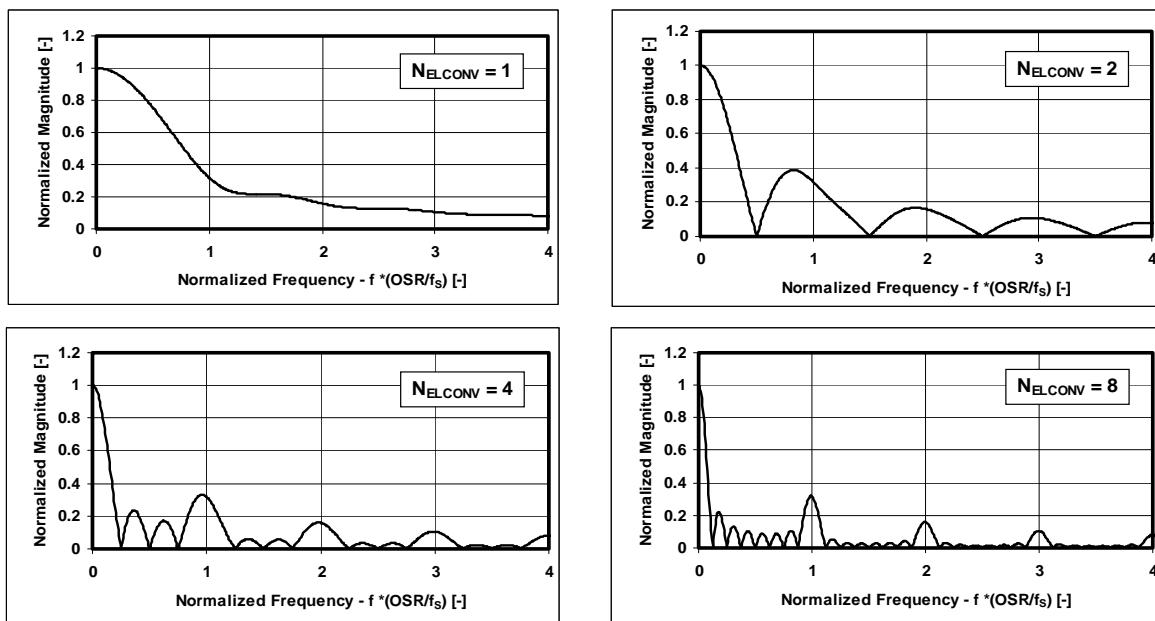

Figure 8.23: Frequency response: normalized magnitude vs. frequency for different N_{ELCONV}
