CYV270M0101EQ

Adaptive Video Cable Equalizer

Features

- Adaptive cable equalization
- SMPTE 259M compliant
- Supports DVB-ASI at 270 Mbps
- Multi standard operation from 143 Mbps to 360 Mbps
- Cable length indicator for SD-SDI data rates
- Maximum cable length adjustment for SD-SDI data rates
- Carrier detect and mute functionality for SD-SDI data rates
- Equalizer bypass mode
- Seamless connection with HOTLink II™ family and HOTLink® receiver
- Equalizes up to 350m of Canare L-5CFB and Belden 1694A coaxial cable at 270 Mbps
- Low power 160 mW at 3.3V
- Single 3.3V supply
- 16-pin SOIC
- 0.18 μm CMOS technology
- Pb-free and RoHS compliant
- Uses Cypress CLEANLink™ technology
- Pin compatible to existing equalizer devices

Functional Description

The CYV270M0101EQ is an adaptive video cable equalizer designed to equalize and restore signals received over 75Ω coaxial cable. The equalizer meets SMPTE 259M data rates and is optimized for performance at 270 Mbps. The CYV270M0101EQ is optimized to equalize up to 350m of Canare L-5CFB and Belden 1694A coaxial cable at 270 Mbps. The CYV270M0101EQ connects seamlessly to the HOTLink II family of transceivers and HOTLink receivers.

The CYV270M0101EQ has DC restoration for compensation of the DC content of the SMPTE pathological patterns. A cable length indicator (CLI) provides an indication of the cable length equalized at SD-SDI data rates. The maximum cable length adjust (MCLADJ) sets the approximate maximum cable length to equalize. The CYV270M0101EQ differential serial outputs (SDO, SDO) mute when the approximate cable length set by MCLADJ is reached. CD/MUTE is a bidirectional pin that provides an indication of the signal present at the equalizer inputs. It also controls muting the outputs of the equalizer.

Power consumption is typically 160 mW at 3.3V.

Table 1. Pin Descriptions - CYV270M0101EQ Single Channel Cable Equalizer

Name	IO Characteristics	Signal Description
Control Signals		
CLI	Analog Output	**Cable Length Indicator.** CLI provides an analog voltage proportional to the equalized cable length.
$\overline{\text{CD}}$/MUTE	LVTTL IO	**Carrier Detect/Mute Indicator.** **Output:** When the incoming data stream is present and the cable length does not exceed that set by MCLADJ, the $\overline{\text{CD}}$/MUTE outputs a voltage less than 0.8V. When the incoming data stream is not present or the cable length exceeds that set by MCLADJ, the $\overline{\text{CD}}$/MUTE outputs a voltage greater than 2.8V. **Input:** When the $\overline{\text{CD}}$/MUTE pin is set LOW, the equalizer's differential serial outputs are not muted. When the $\overline{\text{CD}}$/MUTE pin is set HIGH, the equalizer's differential serial outputs are muted.
MCLADJ	Analog Input	**Maximum Cable Length Adjust.** The maximum equalized cable length is set by the voltage applied to the MCLADJ input. When the maximum cable length set by MCLADJ is reached, CD is driven high and the differential output is muted. If MCLADJ functionality is not needed, this pin should be left floating or tied to ground to allow maximum equalized cable length.
BYPASS	LVTTL Input	**Equalizer Bypass.** When BYPASS is set HIGH, the signal presented at the equalizer's differential serial inputs (SDI, $\overline{\text{SDI}}$) is routed to the equalizer's differential serial outputs (SDO, $\overline{\text{SDO}}$) without equalizing. When BYPASS is set LOW, the incoming video data stream is equalized and presented at the equalizer's serial differential outputs (SDO, $\overline{\text{SDO}}$). In equalizer bypass mode, $\overline{\text{CD}}$/MUTE is not functional.
AGC±	Analog	**Automatic Gain Control.** Place a capacitor of 1 μF between the AGC± pins.
SDO, $\overline{\text{SDO}}$	Differential Output	**Differential Serial Outputs.** The equalized serial video data stream is presented at the SDO/$\overline{\text{SDO}}$ differential serial CML output.
SDI, $\overline{\text{SDI}}$	Differential Input	**Differential Serial Inputs.** SDI/$\overline{\text{SDI}}$ accepts either a single-ended or differential serial video data stream over 75Ω coaxial cable.
Power		
VCC	Power	**+3.3V Power.**
GND	Gnd	**Connect to Ground.**

Equalizer Operation

The CYV270M0101EQ is an adaptive video cable equalizer designed to equalize standard definition (SD) serial digital interface (SDI) video data streams. The CYV270M0101EQ equalizer is optimized to equalize up to 350m of Canare L-5CFB and Belden 1694A cable at 270 Mbps. The device contains one power supply and typically consumes 160 mW power at 3.3V. The adaptive equalizer meets the SMPTE 259M and DVB-ASI video standards. It meets all pathological requirements for SMPTE 259M as defined by RP178. The CYV270M0101EQ Video Cable Equalizer is auto adaptive from 143 Mbps to 360 Mbps.

The CYV270M0101EQ equalizer has variable gain and multiple equalization stages that reverse the effects of the cable. This equalization is achieved by separate regulation of the lower and higher frequency components in the signal to give a clean output eye diagram. The CYV270M0101EQ has DC restoration to compensate the DC content of the SMPTE pathological patterns.

SDI, $\overline{\text{SDI}}$

The CYV270M0101EQ accepts single-ended or differential serial video data streams over 75Ω coaxial cable. It is recommended to AC couple the SDI and $\overline{\text{SDI}}$ inputs as they are internally biased to 1.2V.

SDO, $\overline{\text{SDO}}$

The CYV270M0101EQ has differential serial output interface drivers that use current mode logic [CML] drivers to provide source matching for the transmission line. These outputs are either AC coupled or DC coupled to the HOTLink II SerDes device.

CLI

Cable Length Indicator (CLI) is an analog output that gives an output voltage proportional to the equalized cable length. CLI gives an approximation of the length of cable at the differential serial inputs (SDI, $\overline{\text{SDI}}$). CLI works at standard definition (SD) data rates. The graph in Figure 3 on page 7 illustrates the CLI output voltage at various Belden 1694A cable lengths. With an increase in cable length, CLI output voltage decreases.

MCLADJ

Maximum Cable Length Adjust (MCLADJ) sets the approximate maximum amount of cable to be equalized.

If the MCLADJ voltage is greater than the CLI output voltage, $\overline{\text{CD}}$ is driven high and the equalizer serial differential outputs (SDO, $\overline{\text{SDO}}$) are muted. If the MCLADJ voltage is less than CLI voltage, then the equalizer's differential serial outputs (SDO, $\overline{\text{SDO}}$) are not muted and the incoming data stream is equalized. The graph in Figure 2 on page 7 illustrates the voltage required at MCLADJ input to equalize various Belden 1694A cable lengths for SD data rates. If MCLADJ functionality is not required, this pin should be left floating or tied to ground to allow maximum equalized cable length.

$\overline{\text{CD}}$/MUTE

Carrier Detect/MUTE ($\overline{\text{CD}}$/MUTE) is a bidirectional pin that provides an indication of the signal present at the equalizer's input, or it controls the muting of the equalizer's output.

If $\overline{\text{CD}}$/MUTE is used as an output and the incoming data stream is not present or the cable length exceeds that set by MCLADJ, the voltage at the $\overline{\text{CD}}$/MUTE output is greater than 2.8V. If $\overline{\text{CD}}$/MUTE is used as an output, the incoming data stream is present and the cable length does not exceed that set by MCLADJ, then the voltage at the $\overline{\text{CD}}$/MUTE output is less than 0.8V.

If $\overline{\text{CD}}$/MUTE is used as an input, and set LOW, the equalizer serial outputs are not muted. If the $\overline{\text{CD}}$/MUTE is used as an input and is set HIGH, then the equalizer serial outputs are muted.

When an invalid signal or a signal transmitted with a launch amplitude of less than 500 mV at SD data rates is received, the equalizer's serial outputs are muted and the MCLADJ setting is overwritten.

BYPASS

The CYV270M0101EQ has a bypass mode that allows the user to bypass the equalizer's equalization and DC restoration functions. When the Bypass mode is tied to V_{CC}, the signal presented at the equalizer's differential serial inputs (SDI, $\overline{\text{SDI}}$) is routed to the equalizer's differential serial outputs (SDO, $\overline{\text{SDO}}$) without performing equalization.

When BYPASS is tied to GND, the incoming video data stream is equalized and presented at the equalizer's differential serial outputs (SDO, $\overline{\text{SDO}}$).

In equalizer bypass mode, $\overline{\text{CD}}$/MUTE is not functional.

AGC

Place a capacitor of 1 µF between the AGC± pins of the CYV270M0101EQ equalizer.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... –65°C to +150°C

Ambient Temperature with Power Applied ..... –55°C to +125°C

Supply Voltage to Ground Potential.....–0.5V to +3.8V

DC Voltage Applied to Outputs in High Z State ..... –0.5V to V_{CC} + 0.5V

DC Input Voltage ..... –0.5V to V_{CC}+0.5V

Electro Static Discharge (ESD) HBM.....> 2000 V (JEDEC EIA/JESD-A114A)

Latch Up Current .....> 200 mA

Power Up Requirements

The CYV270M0101EQ contains one power supply. The voltage on any input or IO pin must not exceed the power pin during power up.

Operating Range

Range	Ambient Temperature	V_{CC}
Commercial	0°C to +70°C	+3.3V ±5%

DC Electrical Characteristics

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
V_{CC}	Supply Voltage[1]	–	3.135	3.3	3.465	V
