32-Tap Digitally Programmable Potentiometer (DPP™)

FEATURES

- 32-position linear taper potentiometer
- Non-volatile EEPROM wiper storage
- Low standby current
- Single supply operation: 2.5V – 6V
- Increment up/down serial interface
- Resistance values: 10kΩ, 50kΩ and 100kΩ
- Available in PDIP, SOIC, TSSOP, MSOP and space saving 2 x 2.5mm TDFN packages

APPLICATIONS

- Automated product calibration
- Remote control adjustments
- Offset, gain and zero control
- Tamper-proof calibrations
- Contrast, brightness and volume controls
- Motor controls and feedback systems
- Programmable analog functions

For Ordering Information details, see page 14.

DESCRIPTION

The CAT5114 is a single digitally programmable potentiometer (DPP™) designed as a electronic replacement for mechanical potentiometers and trim pots. Ideal for automated adjustments on high volume production lines, they are also well suited for applications where equipment requiring periodic adjustment is either difficult to access or located in a hazardous or remote environment.

The CAT5114 contains a 32-tap series resistor array connected between two terminals R_H and R_L. An up/down counter and decoder that are controlled by three input pins, determines which tap is connected to the wiper, R_W. The wiper setting, stored in nonvolatile memory, is not lost when the device is powered down and is automatically reinstated when power is returned. The wiper can be adjusted to test new system values without affecting the stored setting. Wiper-control of the CAT5114 is accomplished with three input control pins, $\overline{CS}$, U/$\overline{D}$, and $\overline{INC}$. The $\overline{INC}$ input increments the wiper in the direction which is determined by the logic state of the U/$\overline{D}$ input. The $\overline{CS}$ input is used to select the device and also store the wiper position prior to power down.

The digitally programmable potentiometer can be used as a three-terminal resistive divider or as a two-terminal variable resistor. DPPs bring variability and programmability to a wide variety of applications including control, parameter adjustments, and signal processing.

PIN DESCRIPTIONS

Name	Function
$\overline{INC}$	Increment Control
U/$\overline{D}$	Up/Down Control
R_H	Potentiometer High Terminal
GND	Ground
R_W	Wiper Terminal
R_L	Potentiometer Low Terminal
$\overline{CS}$	Chip Select
V_{CC}	Supply Voltage

PIN FUNCTION

$\overline{INC}$: Increment Control Input

The $\overline{INC}$ input moves the wiper in the up or down direction determined by the condition of the U/$\overline{D}$ input.

U/$\overline{D}$: Up/Down Control Input

The U/$\overline{D}$ input controls the direction of the wiper movement. When in a high state and $\overline{CS}$ is low, any high-to-low transition on $\overline{INC}$ will cause the wiper to move one increment toward the R_H terminal. When in a low state and $\overline{CS}$ is low, any high-to-low transition on $\overline{INC}$ will cause the wiper to move one increment towards the R_L terminal.

R_H: High End Potentiometer Terminal

R_H is the high end terminal of the potentiometer. It is not required that this terminal be connected to a potential greater than the R_L terminal. Voltage applied to the R_H terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND.

R_W: Wiper Potentiometer Terminal

R_W is the wiper terminal of the potentiometer. Its position on the resistor array is controlled by the control inputs, $\overline{INC}$, U/$\overline{D}$ and $\overline{CS}$. Voltage applied to the R_W terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND.

R_L: Low End Potentiometer Terminal

R_L is the low end terminal of the potentiometer. It is not required that this terminal be connected to a potential less than the R_H terminal. Voltage applied to the R_L terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND. R_L and R_H are electrically interchangeable.

$\overline{CS}$: Chip Select

The chip select input is used to activate the control input of the CAT5114 and is active low. When in a high state, activity on the $\overline{INC}$ and U/$\overline{D}$ inputs will not affect or change the position of the wiper.

DEVICE OPERATION

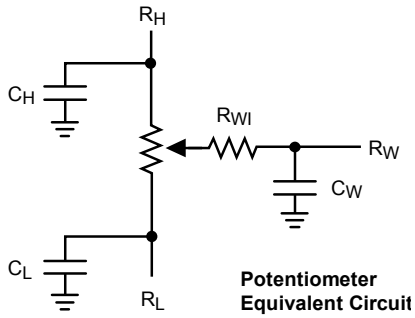
The CAT5114 operates like a digitally controlled potentiometer with R_H and R_L equivalent to the high and low terminals and R_W equivalent to the mecha–nical potentiometer's wiper. There are 32 available tap positions including the resistor end points, R_H and R_L. There are 31 resistor elements connected in series between the R_H and RL terminals. The wiper terminal is connected to one of the 32 taps and controlled by three inputs, $\overline{INC}$, U/$\overline{D}$ and $\overline{CS}$. These inputs control a seven-bit up/down counter whose output is decoded to select the wiper position. The selected wiper position can be stored in non-volatile memory using the $\overline{INC}$ and $\overline{CS}$ inputs.

With $\overline{CS}$ set LOW the CAT5114 is selected and will respond to the U/$\overline{D}$ and $\overline{INC}$ inputs. HIGH to LOW transitions on $\overline{INC}$ wil increment or decrement the wiper (depending on the state of the U/$\overline{D}$ input and seven-bit counter). The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. The value of the counter is stored in nonvolatile memory whenever $\overline{CS}$ transitions HIGH while the $\overline{INC}$ input is also HIGH. When the CAT5114 is powered-down, the last stored wiper counter position is maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the counter is set to the value stored.

With $\overline{INC}$ set low, the CAT5114 may be de-selected and powered down without storing the current wiper position in nonvolatile memory. This allows the system to always power up to a preset value stored in non-volatile memory.

OPERATION MODES

$\overline{INC}$	$\overline{CS}$	U/$\overline{D}$	Operation
High to Low	Low	High	Wiper toward H
High to Low	Low	Low	Wiper toward L
High	Low to High	X	Store Wiper Position
Low	Low to High	X	No Store, Return to Standby
X	High	X	Standby



Potentiometer Equivalent Circuit

ABSOLUTE MAXIMUM RATINGS (1)

Parameters	Ratings	Units
Supply Voltage V_{CC} to GND	-0.5 to +7V	V
Inputs $\overline{CS}$ to GND	-0.5 to V_{CC} +0.5	V
$\overline{INC}$ to GND	-0.5 to V_{CC} +0.5	V
U/$\overline{D}$ to GND	-0.5 to V_{CC} +0.5	V
H to GND	-0.5 to V_{CC} +0.5	V
L to GND	-0.5 to V_{CC} +0.5	V
W to GND	-0.5 to V_{CC} +0.5	V

Parameters	Ratings	Units
Operating Ambient Temperature Industrial ('I' suffix)	-40 to +85	ºC
Junction Temperature	+150	ºC
Storage Temperature	-65 to 150	ºC
Lead Soldering (10s max)	+300	ºC

RELIABILITY CHARACTERISTICS

Symbol	Parameter	Test Method	Min	Typ	Max	Units
V_{ZAP} (2)	ESD Susceptibility	MIL-STD-883, Test Method 3015	2000			V
I_{LTH} (2)(3)	Latch-Up	JEDEC Standard 17	100			mA
T_{DR}	Data Retention	MIL-STD-883, Test Method 1008	100			Years
N_{END}	Endurance	MIL-STD-883, Test Method 1003	1,000,000			Stores

DC ELECTRICAL CHARACTERISTICS

V_{CC} = +2.5V to +6V unless otherwise specified

Power Supply

Symbol	Parameter	Conditions	Min	Typ	Max	Units
V_{CC}	Operating Voltage Range		2.5	–	6.0	V
I_{CC1}	Supply Current (Increment)	V_{CC} = 6V, f = 1MHz, I_W = 0	–	–	100	µA
		V_{CC} = 6V, f = 250kHz, I_W = 0	–	–	50	µA
I_{CC2}	Supply Current (Write)	Programming, V_{CC} = 6V	–	–	1000	µA
		V_{CC} = 3V	–	–	500	µA
I_{SB1} (3)	Supply Current (Standby)	$\overline{CS}$ = V_{CC} - 0.3V U/$\overline{D}$, $\overline{INC}$ = V_{CC} - 0.3V or GND	–	–	1	µA

Notes

(1) Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions outside of those listed in the operational sections of this specification is not implied. Exposure to any absolute maximum rating for extended periods may affect device performance and reliability.

(2) This parameter is tested initially and after a design or process change that affects the parameter.

(3) Latch-up protection is provided for stresses up to 100mA on address and data pins from -1V to V_{CC} + 1V.

(4) I_W = source or sink.

(5) These parameters are periodically sampled and are not 100% tested.

Logic Inputs

Symbol	Parameter	Conditions	Min	Typ	Max	Units
I_{IH}	Input Leakage Current	$V_{IN} = V_{CC}$	–	–	10	µA
I_{IL}	Input Leakage Current	$V_{IN} = 0V$	–	–	-10	µA
V_{IH2}	CMOS High Level Input Voltage	2.5V ≤ V_{CC} ≤ 6V	V_{CC} x 0.7	–	V_{CC} + 0.3	V
V_{IL2}	CMOS Low Level Input Voltage		-0.3	–	V_{CC} x 0.2	V

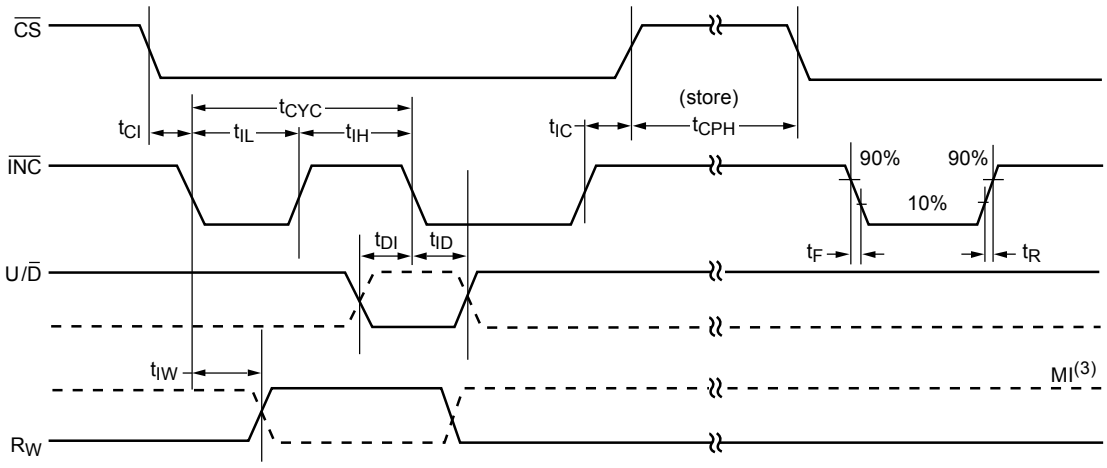
t_{PU} (2)	Power-up to Wiper Stable	–	–	1	ms
t_{WR}	Store Cycle	–	5	10	ms

A.C. TIMING



Notes

(1) Typical values are for T_A = 25ºC and nominal supply voltage.

(2) This parameter is periodically sampled and not 100% tested.

(3) MI in the A.C. Timing diagram refers to the minimum incremental change in the W output due to a change in the wiper position.

APPLICATIONS INFORMATION
