LC01700PW — CMOS LSI FM tuner IC for VICS

Overview

LC01700PW is an FM tuner IC for vehicle-mounted VICS incorporating FM FE, IF, OP AMP, PLL.
VICS tuner can be developed by one chip.
This IC can make up a small FM tuner module mounted for navigation.

Features

- Dedicated FM tuner IC for VICS in Japan and RDS in Europe.
- Variable gain LNA incorporated.
- A pulse counter detection method employed in the FM detection circuit. No adjustment necessary.
- Less number of external parts.
- BUS control tuner IC enabling control with I^2C BUS.
- OP AMP provided to adjust the composite frequency level appropriate to VICS and RDS.
- 6Bit-ADC incorporated to enable digital output of S meter.

Functions

- FM-FE+IF+OP AMP+PLL

Specifications

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V_{DD} max		6	V
Maximum input voltage	V_{DD} H		6	V
Maximum output voltage	V_{DD} L		6	V
Allowable power dissipation	Pd max	Ta ≤ 85°C	400	mW
Operating temperature	Topr		-40 to +85	°C
Storage temperature	Tstg		-50 to +150	°C

Operating supply voltage range at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	V_{DD}	Not to exceed the absolute maximum rating	4.5 to 5.5	V
Supply voltage range	V_{DD}		5.0	V

Serial interface voltage level

V_{DD} : Communications bus voltage

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
High level input voltage	V_{IH}		2.4		V_{DD}	V
Low level input voltage	V_{IL}		0.0		0.7	V
High level output voltage (open·drain)	V_{OH}				V_{DD}*	V
Low level output voltage (open·drain)	V_{OL}		0.0		$0.2V_{DD}$	V

* High level output voltage causes the open drain to become the high-impedance state.
Since the drain is pulled up to V_{DD}, the voltage is equal to V_{DD}.

Electrical Characteristics at Ta = 25°C, unless otherwise specified. fc = 83MHz, Vin = 60dBμVEMF, fm = 1kHz,
Audio filter : HPF =100Hz, LPF = 15kHz
Sample application circuit (Sample application circuit) look-up

Pin Description

Pin No.	Pin Name	Type	Description
1	MIX_ON	OUT	1stMIX signal output (-)
2	MIX_OP	OUT	1stMIX signal output (+)
3	MIX_IP	IN	1stMIX signal input (+)
4	MIX_IN	IN	1stMIX signal input (-)
5	LNA_ON	OUT	LNA signal output (-)
6	LNA_OP	OUT	LNA signal output (+)
7	V_{DD}_RF	POWER	RF block power
8	FM_IP	IN	FM signal input (+)
9	FM_IN	IN	FM signal input (-)
10	GND_RF	GND	RF block GND
11	GND_LO	GND	LO block GND
12	V_{DD}_LO	POWER	LO block power
13	LOSC2	IN/OUT	VCO resonant load pin 2
14	LOSC1	IN/OUT	VCO resonant load pin 1
15	VT	OUT	Charge pump output
16	NC1	NC	NC
17	NC2	NC	NC
18	STDO	OUT	Monitor output/reset detection output
19	SDA	IN/OUT	Serial data I/O (I^2C)
20	SCL	IN	Serial clock input (I^2C)
21	XOSC2	IN/OUT	Crystal oscillator pin 2
22	XOSC1	IN/OUT	Crystal oscillator pin 1
23	V_{SS}	GND	Digital block GND
24	V_{DD}_IO	POWER	5V power for interface
25	V_{DD}	OUT	Digital block power (built-in regulator output)
26	GND_IF	GND	IF block GND
27	COMPOUT	OUT	Composite signal output
28	DETREF	IN/OUT	FM detection signal amplifier reference voltage
29	DETADJ	OUT	FM detection signal amplitude adjustment
30	DETINP	IN	FM detection signal amplifier input (+)
31	DETINN	IN	FM detection signal amplifier input (-)
32	FDO	OUT	FM detection circuit output
33	SMETER	IN/OUT	S meter output
34	CRSSI	IN/OUT	Connection of smoothing capacitor for S-meter/S-meter output voltage adjustment
35	LIM2	IN/OUT	Limiter offset canceling capacitor connection 2
36	LIM1	IN/OUT	Limiter offset canceling capacitor connection 1
37	NC3	NC	NC
38	NC4	NC	NC
39	IF2nd_IN	IN	2ndMIX signal input (-)
40	IF2nd_IP	IN	2ndMIX signal input (+)
41	IF1stOUT	OUT	1st IF amplifier signal output
42	V_{DD}_IF	POWER	IF block power
43	IF1st_IN	IN	1st IF amplifier signal input (-)
44	IF1st_IP	IN	1st IF amplifier signal input (+)
45	V_{DD}_AGC	POWER	Pin diode AGC circuit power
46	FMAGC	OUT	FM pin diode driver output
47	CAGC	IN/OUT	AGC circuit smoothing capacitor connection 2
48	LNAAGC	IN/OUT	AGC circuit smoothing capacitor connection 1

Communications Specifications

Communications specifications are shown below :

Serial Interface(I^2C-bus) ; Serial interface (I^2C-bus)

Send/receive is made via I^2C-bus that consists of two bus lines, each being a serial • data • line (SDA) and serial • clock • line (SCL). This bus enables 8-bit bi-directional serial data transmission at maximum 400kbit/s (fast mode). This is not compatible with the Hs mode.

1. Terms used in I^2C

The following terms are used in I^2C.

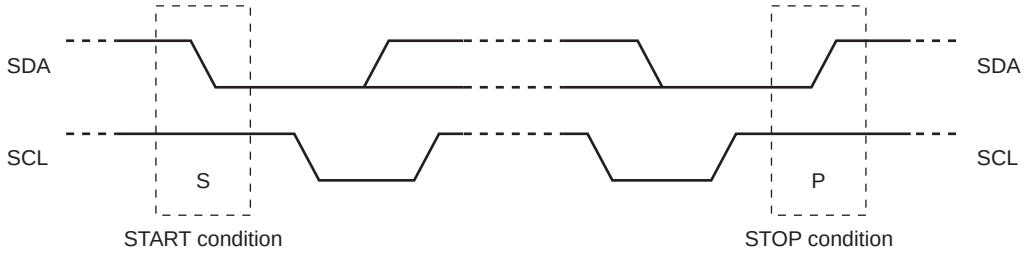
Terms	Description
Transmitter	Device to send data to the bus
Receiver	Device to receive data from the bus
Master	Device to start data transmission, to generate the clock signal, and to end data transmission
Slave	Device whose address is designated by the master

2. "Start" and "Stop" conditions

"Start" condition must be satisfied at start of data communications and "Stop" condition must be satisfied at end of communications.

The condition in which the SDA line changes from "H" to "L" with SCL at "H" is called the "Start" line.

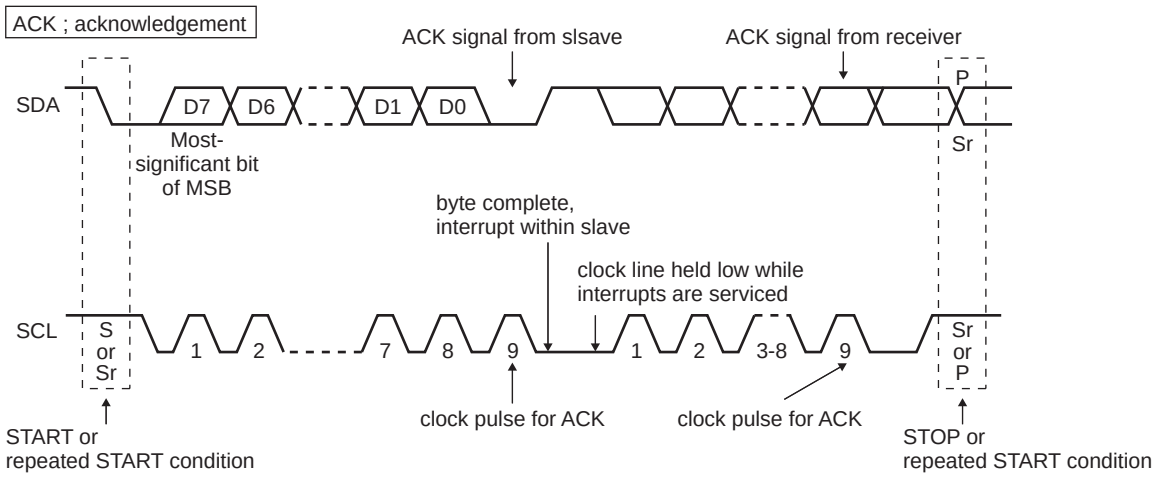
The condition in which the SDA line changes from "L" to "H" with SCL at "H" is called the "Stop" condition.



3. Data transmission

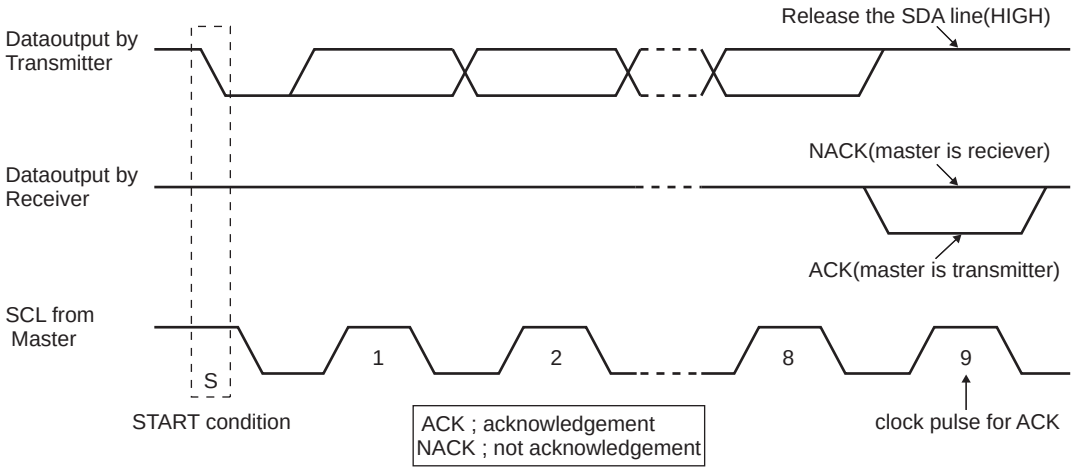
The length of each byte output to the SDA line is always 8 bits. An acknowledge bit is always necessary after each byte, Data is transmitted sequentially from the most significant bit (MSB).

During data transfer, the slave address is transmitted after the "Start" condition (S). Data transfer is always ended by the "Stop" condition (P) generated by the master.



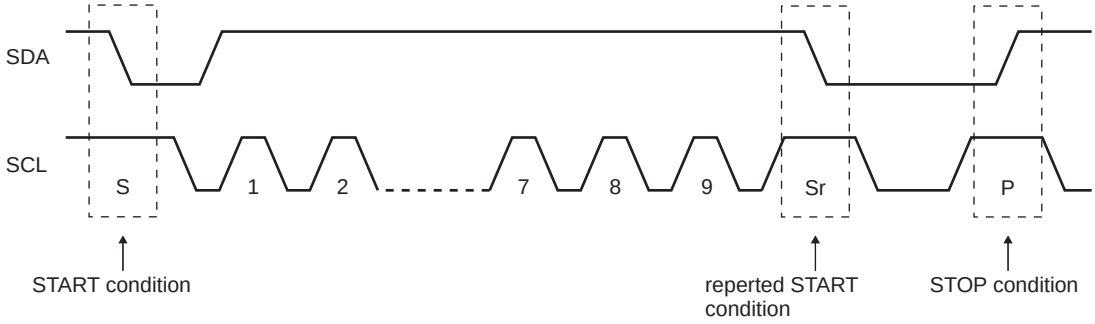
4. Acknowledge (Confirmation of reception)

When the master generates the acknowledge clock pulse, the transmitter opens the SDA line (SDA line entering the "H" state). When the acknowledge clock pulse is in the "H" state, the receiver sets the SDA line to "L" each time it receives one byte (eight bits) of data. When the master functions as receiver, the master informs the end of data to the slave by omitting acknowledgement at the end of data sent from the slave.

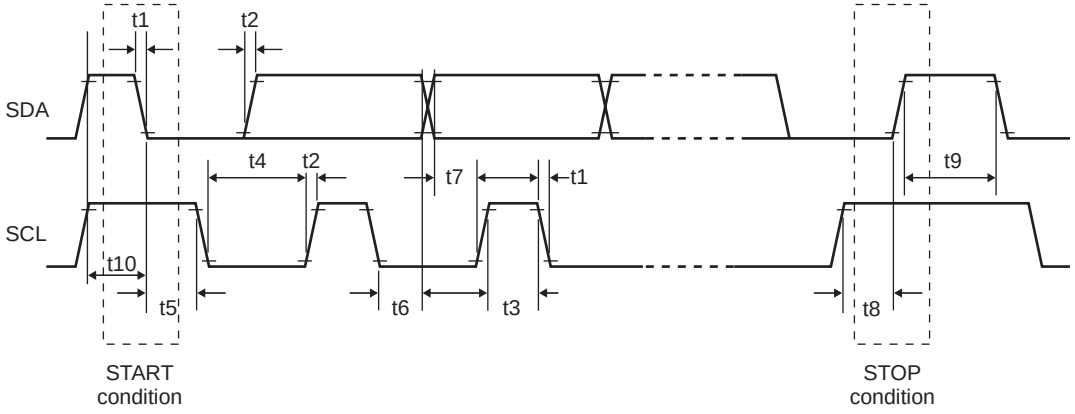


5. Software reset

After power ON, enter the signal as follows to avoid malfunction. If the communication is interrupted (microcomputer reset, etc.), entry of the following signal enables normal operation.



6. Electrical Specification and Timing for I/O Stages



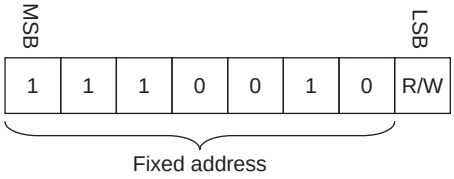
Bus line characteristics

Parameter	Symbol	FAST-MODE		unit	For SCL = 100kHz (Example)
		min	max		
SCL clock frequency	fSCL	-	400	kHz	100
SDA, SCL fall time	t1	20+0.1Cb	300	ns	-
SDA, SCL rise time	t2	20+0.1Cb	300	ns	-
SCL "H" time	t3	0.6	-	μs	3
SCL "L" time	t4	1.3	-	μs	7
"Start" condition hold time	t5	0.6	-	μs	10
Data hold time For I^2C bus device	t6	0.3	-	μs	-
Data setup time	t7	0.1	-	μs	3
"Stop" condition setup time	t8	0.6	-	μs	10
"Stop"-"Start" bus free time	t9	1.3	-	μs	20
"Start" condition setup time	t10	0.6	-	μs	-
Bus line capacitive load	Cb	-	400	pF	-

7. Definition of each bit in one byte

7-1. Slave address

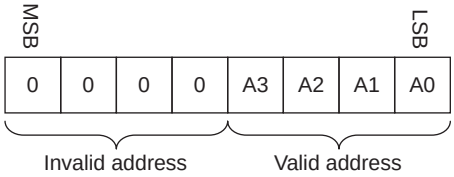
The slave address consists of a fixed seven-bit address "1110010" uniqueto the chip and the eighth bit or a data direction bit (R/W) : Send (Write) when this bit is "0" and Receive (Read) when this bit is "1".



R/W	BIT
READ	1
WRITE	0

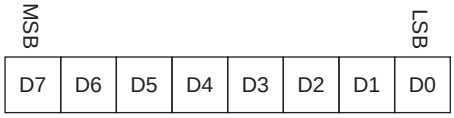
7-2. Register address

Since the total number of internal registers is 16, 4-bit data set on the MSB side becomes invalid.



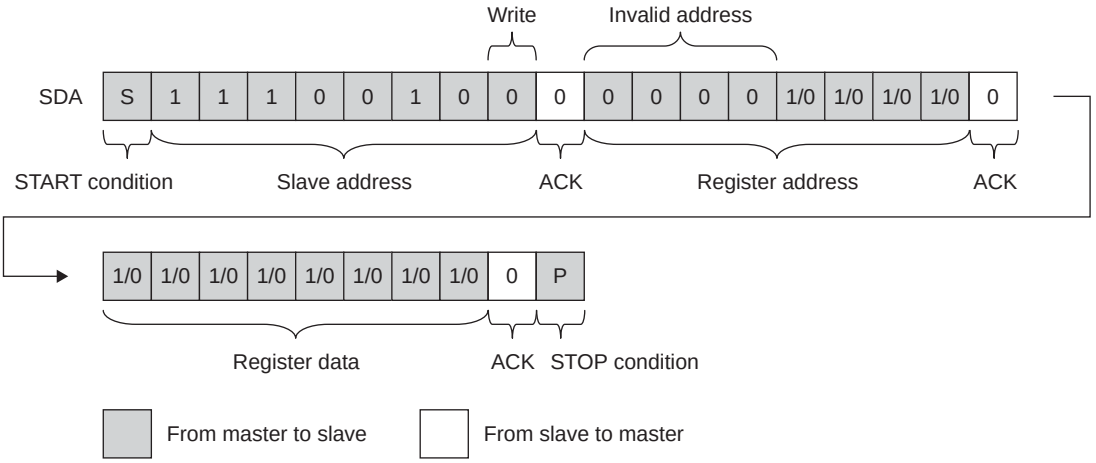
7-3. Register data

Each register data consists of eight bits.

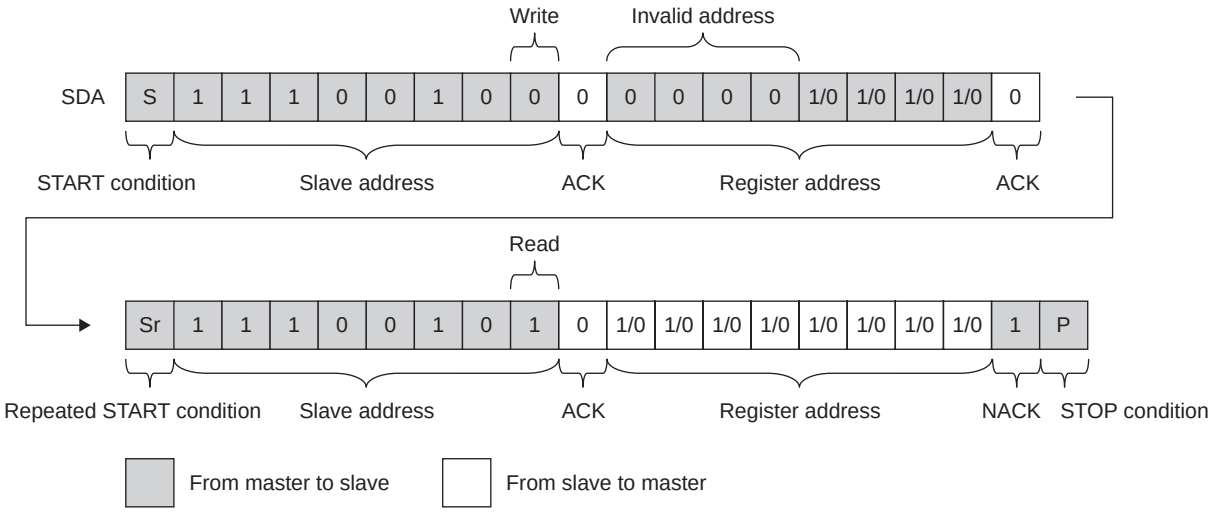


8. Command Format

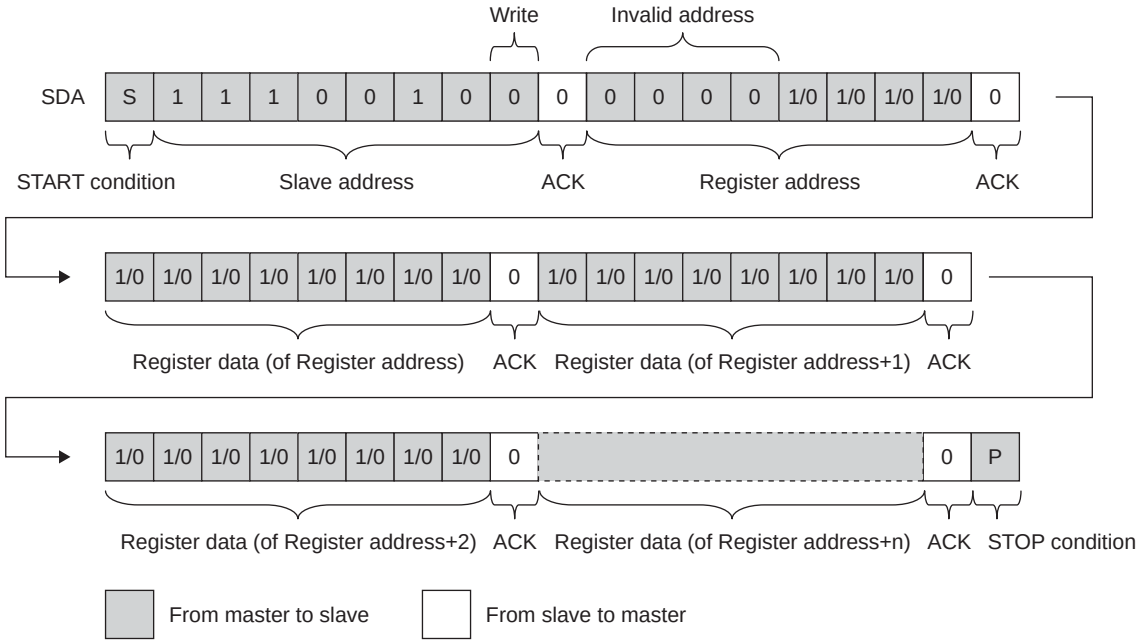
8-1. Individual register • data writing



8-2. Individual register • data reading

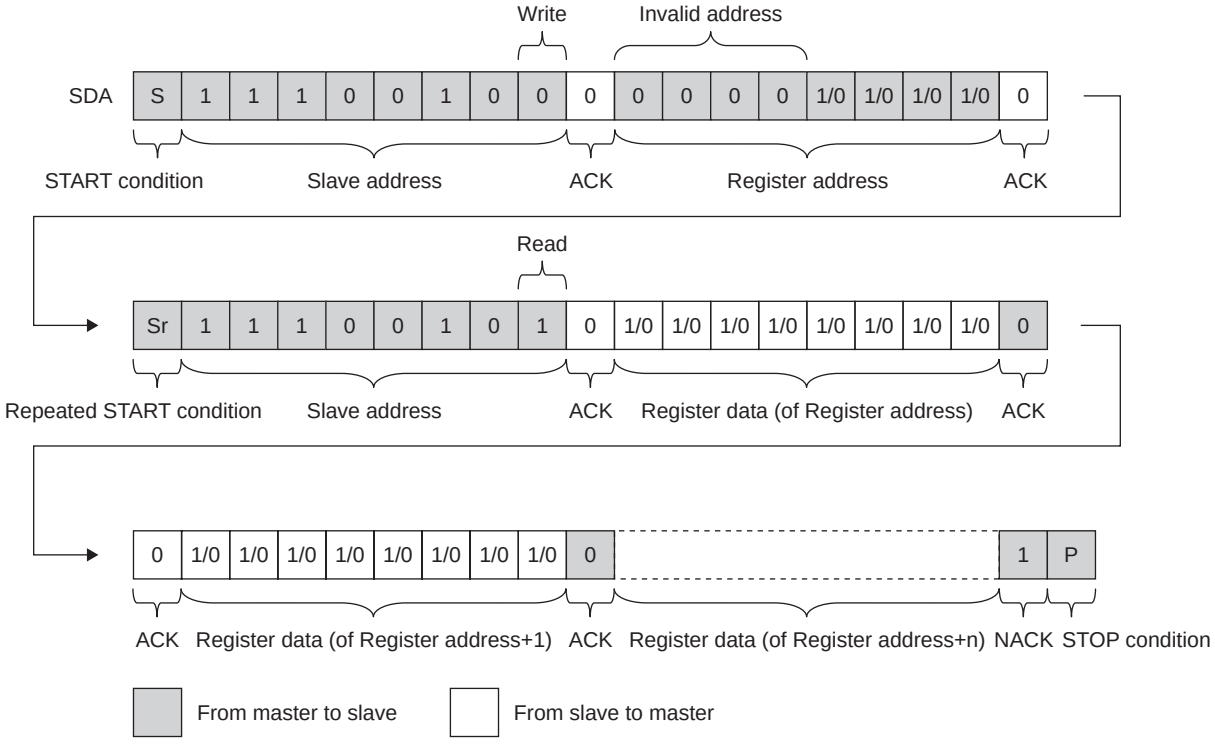


8-3. Consecutive register • data writing



Continuous data transmission after transmission of initially-set address data of register • data writing sequence enables writing of data in the consecutive register • data area. In this case, the register • address increases by one address from the initially-set address of the sequence and continues increasing till the "Stop" condition (P) is generated.

8-4. Consecutive register • data reading



When the master returns ACK (0 data) after reading of the initial register • address • data of read sequence, the register • address increases by one address, enabling consecutive reading of data corresponding to each register address. If the master does not return ACK (0 data), the register address does not increase.
