Linear Division Operational Amplifiers

## Description

The μA101A, μA201A, and μA301A are general purpose monolithic operational amplifiers constructed using the Fairchild Planar Epitaxial process. These integrated circuits are intended for applications requiring low input offset voltage or low input offset current. The accuracy of long interval integrators, timers, and sample-and-hold circuits is improved due to the low drift and low bias currents of the μA101A, μA201A, or μA301A. Frequency response may be matched to the individual circuit need with one external capacitor. The absence of latch up coupled with internal short circuit protection make the μA101A, μA201A and μA301A virtually foolproof.

- Low Offset Current And Voltage
- Low Offset Current Drift
- Low Bias Current
- Short Circuit Protected
- Low Power Consumption

## Notes

1. T<sub>J</sub> Max = 150°C for the Molded DIP and SO-8, and 175°C for the Metal Can.
2. Ratings apply to ambient temperature at 25°C. Above this temperature, derate the 8L-Metal Can at 6.7 mW/°C, the 8L-Molded DIP at 7.5 mW/°C and the SO-8 at 6.5 mW/°C.
3. For supply voltage less than ± 15 V, the absolute maximum input voltage is equal to the supply voltage.
4. Short circuit may be ground or either supply. μA101A and μA201A ratings apply to +125°C case temperature or +75°C ambient temperature. μA301A ratings apply for case temperatures to 70°C.
