Dual P-Channel 2.5V Specified PowerTrench™ MOSFET

General Description

These P-Channel 2.5V specified MOSFETs are produced using Fairchild Semiconductor's advanced PowerTrench process that has been especially tailored to minimize on-state resistance and yet maintain low gate charge for superior switching performance.

These devices have been designed to offer exceptional power dissipation in a very small footprint for applications where the bigger more expensive SO-8 and TSSOP-8 packages are impractical.

Applications

- Load switch
- Battery protection
- Power management

Features

- -1.9 A, -20 V. $R_{DS(on)} = 0.170 \Omega @ V_{GS} = -4.5 V$
 $R_{DS(on)} = 0.250 \Omega @ V_{GS} = -2.5 V$
- Low gate charge (3 nC typical).
- Fast switching speed.
- High performance trench technology for extremely low $R_{DS(on)}$.
- SuperSOT™-6 package: small footprint (72% smaller than standard SO-8); low profile (1mm thick).

Notes:

- $R_{\theta JA}$ is the sum of the junction-to-case and case-to-ambient resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\theta JC}$ is guaranteed by design while $R_{\theta JA}$ is determined by the user's board design. Both devices are assumed to be operating and sharing the dissipated heat energy equally.
