

NT91214/15 Series

Tone/Pulse Dialer

Features

- One touch redial operation
- Tone/Pulse switchable
- 32 digit capacity for redialing
- Automatic mixed redialing (last number redial) of pulse to DTMF with multiple automatic access pauses
- PABX auto-pause is 2.2 seconds
- DTMF Timing:
 - Manual dialing: minimum duration for bursts and pauses
 - Redialing: calibrated timing
- Hands-Free control function
- Wide operating voltage range: 2V to 5.5V
- Key-in beep tone output
- Digits dialed manually after redialing are cascable and stored as additional digits for the next redialing
- Uses inexpensive ceramic resonator (3.58 MHz)
- Two versions for different telephone systems
- Built-in power up reset circuit
- Four extra function keys: flash, pause, redial and DP or
 - DTMF mixed dialing
- 4 x 4 (or 2 x 8) keyboard can be used
- Low standby current

General Description

The NT91214/15 is a single-chip, silicon gate, CMOS integrated circuit with an on-chip oscillator for a 3.58MHz crystal or ceramic resonator. It provides a dialing pulse (DP) or dual tone multi-frequency (DTMF) dialing. A standard 4 x 4 matrix keyboard can be used to support either DP or DTMF modes.

Up to 32 digits can be saved in the on-chip RAM for redialing. In the DTMF mode, a short minimum tone duration and minimum intertone pause allows rapid dialing. Maximum tone duration depends on the key depression time during manual dialing.

Pin Configurations

Keyboard Assignments

1	2	3	F1	$\overline{R1}$
4	5	6	F2	$\overline{R2}$
7	8	9	P	$\overline{R3}$
* / T	0	#	RD	$\overline{R4}$

$\overline{C1}$ $\overline{C2}$ $\overline{C3}$ GND

1. * / T -- In PULSE mode this key works as Pulse → DTMF key (T key). In DTMF mode the key works as * key. * / T key will occupy one memory digit in either use.
2. F1 -- Flash key. The break time is 297 ms or 96 ms (NT91214/15 respectively)
3. F2 -- Flash key for break time 640 ms
4. P -- Pause key (2.2 seconds)
5. RD -- One key redial key
6. # -- In PULSE mode this key input is neglected. In DTMF mode this key works as # key.

Block Diagram

Absolute Maximum Ratings*

Supply Voltage (VDD) ≤ 6.0V
 Input Voltage (VIN) VSS - 0.3V to VDD + 0.3V
 Output Voltage (VOUT) VSS - 0.3V to VDD + 0.3V
 Output Voltage (VOUT)(\overline{DP} , \overline{XMIT} \overline{MUTE}) ≤ 1.2V
 Tone Output Current (ITONE) ≤ 50mA
 Power Dissipation (PD) ≤ 500mW
 Operating Temperature (Top) -20°C to +70°C
 Storage Temperature (Tstg) -40°C to +150°C

***Comments**

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

Operating Procedures

Symbol Definitions:

In the description below, signals are defined in terms of the key or switch which is activated.

Off Hook means the phone is off the hook.

On Hook means that the phone is on the hook.

D1 represents for the first digit dialed in a string of digits.

Dn (**Dk**) represents for the last digit dialed in a string of digits.

Dn+1 represents for the beginning of a new string of digits.

Dn+m represents for the last digit in a new string of digits.

HFI↓ represents for the switch that activates the HANDS-FREE DIALING mode going low

***/T** is the Pulse-to-DTMF key

RD is the Redial key.

0 is the Zero key.

P is the Pause key.

F is the Flash key.

Recommended Operation:

1. PULSE mode operation

a. **Off Hook** **D1** ... **Dn**

PULSE mode is defined as the INITIAL mode, provided

the first keyboard input is not the ***/T** key following the **Off Hook** condition and the mode selection pin is

floating (MODE IN = VDD or floating).

b. On Hook **HFI↓** **D1** ... **Dn**

Pulse mode is defined as the INITIAL mode, provided the key input **D1** is not ***/T** while the mode selection pin is VDD or floating. The chip will pause for 824 ms automatically after it detects an **Off Hook** condition or if the **HFI↓** key is depressed. It then proceeds with pulse or DTMF dialing if any keys have been depressed.

The dialing rate or make/break ratio is decided at the first key entry by checking the MODE IN status and will

not be altered. The MODE IN status can only switch the DIALING mode from PULSE to DTMF after the first

key entry.

2. DTMF mode operation

a. **Off Hook** **D1** ... **Dn** or **On Hook** **HFI↓** **D1** ... **Dn**

DTMF mode is defined as the INITIAL mode if the mode selection pin MODE IN is VSS.

b. **Off Hook** ***/T** **D1** ... **Dn** or **On Hook** **HFI↓** ***/T** **D1** ... **Dn**

The INITIAL mode is PULSE mode if the mode selection pin, MODE IN, is VDD or floating. The ***/T** key can switch the DIALING mode to TONE mode.

Unlike NORMAL mode switching, the ***/T** key entry,

as the first key pressed, will not produce any pause time. There are only 31 digits of redial memory available in the buffer to be used for operations a and b, since the mode switching key, */T, will occupy one digit of space.

3. Manual dialing with automatic access pause

a. Off Hook O P D1 ... Dn

pause key entries can be accepted and stored in the redial memory. Each is stored as a digit.

Each key-in will provide a pause of 3.57 seconds, depending on which model is being used.

4. Redial

a. On Hook RD or On Hook HF1↓ RD

Up to 32 digits (in PULSE mode) or 31 digits (in TONE mode) can be dialed using the RD key.

The RD key is disabled while PULSE or TONE signals are being transmitted. Redial will also be inhibited if the last number dialed exceeds 32 digits because the redial memory can only hold 32 digits.

b. Off Hook RD D1 .. Dn or On Hook
HF1↓ RD D1 .. Dn

After pressing the RD key, digits may be added to the number in redial memory. When finished dialing, the redial memory will contain the original digits, plus the digits dialed after pressing RD. Each time the redial key is pressed, the stored number will be dialed exactly the same as it was previously, regardless of the status of the MODE IN pin.

5. TONE/PULSE switching operation

a. On Hook D1 ... Dn MODE IN pin

← PULSE Mode

switched to VSS Dn+1 ... Dn+m

→ DTMF Mode →

The mode selection pin is always checked for TONE or PULSE mode key entry. Dialing can be switched from PULSE to TONE mode, but not from TONE to PULSE mode. Switching the MODE IN pin to the original digits plus the digits dialed after pressing will cause the chip to store a */T digit prior to the first tone digit in the redial memory and will automatically insert a 2.2 second pause before the tone digits are dialed out. After the mode has been switched, the status of the mode selection pin will no longer be checked. Therefore, it will not be possible to switch from TONE to PULSE mode.

b. Off Hook D1 ... Dn */T Dn+1

← PULSE Mode →

. . . Dn+m

DTMF Mode →

PULSE mode is initially defined with the mode selection pin, MODE IN, equal to VDD or floating. At this time, the mode can be switched to DTMF by pressing the */T key. DTMF mode will begin as soon as the last pulse has been transmitted. In this mode, Dn+1 through Dn+m are sent through the TONE OUT pin as DTMF signals. If a P key entry is contained in the series of digits before or after the */T entry, or the MODE IN switch is depressed, 2.2 second pause will be added to the automatically inserted pausetime, which is also 3.57 seconds. Both of the

above switching modes can store as many as 31 digits

in the redial memory.

6. One-key redialing

If the dialing of [D1] to [Dn] is finished, pressing [RD] will cause the pulse dialing pin to go low for 1.67 seconds of break time and an 824 ms pause will automatically be added. If the pulses of the number dialed with [D1] to [Dn] have not finished, the pressing of the redial key will be ignored.

7. Flash dialing

The flash keys emulate quick On-Off Hook operations.

Pressing the flash keys, [F1] or [F2], will cause a

break of 96 ms or 640 ms (or, 297 ms or 640 ms, depending on the model) on the \overline{DP} output pin. Then, it pauses for 824 ms and continues dialing the digits, [D1] to [Dn]. These digits are then stored in the redial memory.

Each time the flash key is pressed, the redial memory will

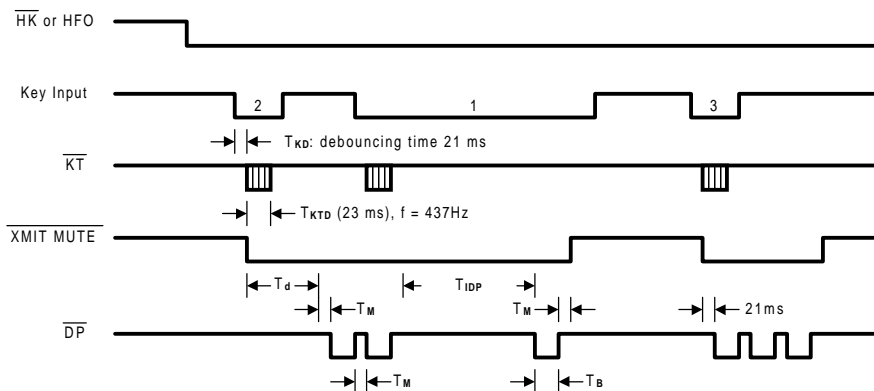

be cleared to store a new entry. In addition, the MODE IN

status will be checked again for the setting of the TONE/PULSE DIALING mode.

Similarly, to make sure that the IC is working properly, new flash key inputs will be ignored as long as the digits that were dialed have not finished.

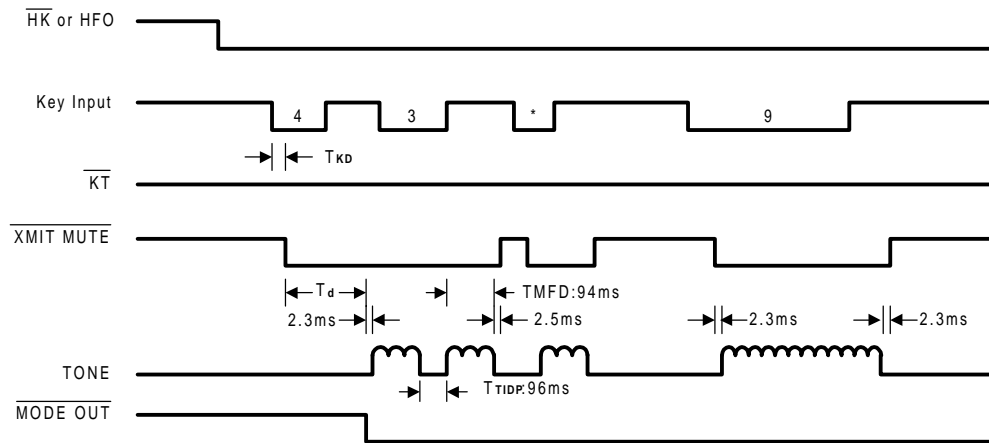

Timing Waveforms

1. Timing Waveform in PULSE Mode:

- Td: Delay time of Key valid to dialing signal out, typically 0ms
- TIDP: Inter-digit pause time
- TKT0: Key-in tone duration
- TKD: Debouncing time

Note: "HK" or "HFO" indicates chip works when hook switch "HK" goes low or Hands-Free control output HFO goes high.

Timing Waveforms (continued)
2. Timing Waveform in TONE Mode:
(i) Normal Dialing

(ii) After (i), Redialing

Timing Waveforms (continued)
3. Timing waveform for SWITCHING Mode Operation:

(i) By mode selection pin switches

(ii) By */T key entry

 T_{PAU} : Pause time (2.2 secs)

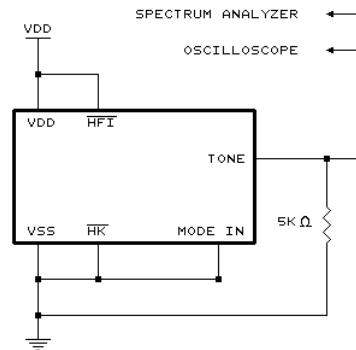

Timing Waveforms(continued)
4. One Key Redial (DTMF mode used as example):

$T_{\Delta OBK}$: Break time (2.2 secs)

5. Flash Dialing (DTMF mode used as example):

T_{fsh} : flash time 96 or 640 ms (F1 or F2 respectively) for NT91215
 flash time 297 or 640 ms (F1 or F2 respectively) for NT91214
