16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## Preliminary

This document is a preliminary Target Spec. and some of the contents are subject to change without notice.

## DESCRIPTION

- The M5M4V16169DTP/RT is a 16M-bit Cached DRAM which integrates input registers, a 1,048,576-word by 16-bit dynamic memory array and a 1024-word by 16-bit static RAM array as a Cache memory (block size 8x16) onto a single monolithic circuit. The block data transfer between the DRAM and the data transfer buffers (RB1/RB2/WB1/WB2) is performed in one instruction cycle, a fundamental advantage over a conventional DRAM/SRAM cache. The RAM is fabricated with a high performance CMOS process, and is ideal for large-capacity memory systems where high speed, low power dissipation, and low cost are essential. The use of quadruple-layer polysilicon process combined with silicide and double layer aluminum wiring technology, a single-transistor dynamic storage stacked capacitor cell, and a six-transistor static storage cache cell provide high circuit density at reduced costs.

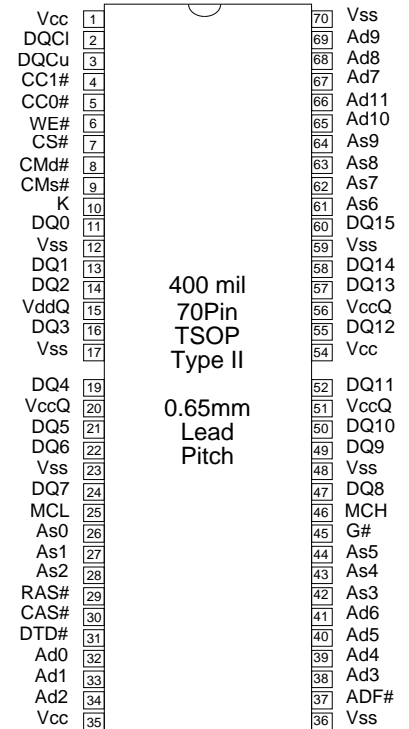

## FEATURES

Type name	SRAM Access/cycle	DRAM Access/cycle	Power Dissipation (Typ)
M5M4V16169TP/RT-7	5.6ns/7ns	49ns/70ns	DRAM: 530 SRAM: 860
M5M4V16169TP/RT-8	6.4ns/8ns	56ns/80ns	DRAM: 500 SRAM: 800
M5M4V16169TP/RT-10	8.0ns/10ns	60ns/90ns	DRAM: 430 SRAM: 660
M5M4V16169TP/RT-15	8.0ns/15ns	75ns/120ns	DRAM: 330 SRAM: 420

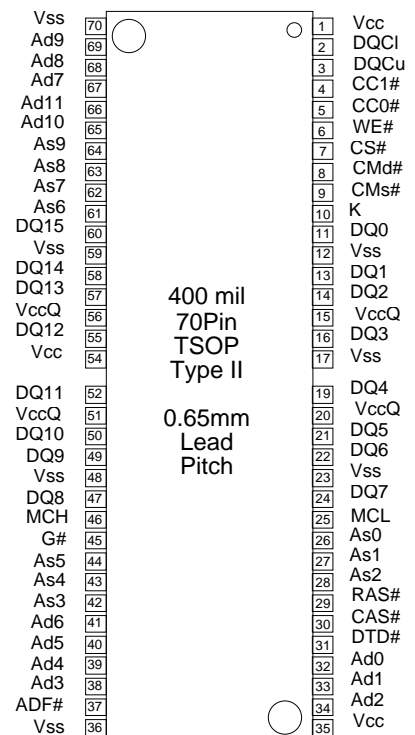

- # 70-pin,400-mil TSOP (type II) with 0.65mm lead pitch and 23.49mm package length.
- # Multiplexed DRAM address inputs for reduced pin count and higher system densities.
- # Selectable output operation (transparent / latched / registered) using set command register cycle.
- # Single 3.3V +/- 0.3V Power Supply. (3.3V +/- 0.15V for -7 part)
- # 2048 refresh cycles every 64ms (Ad0->Ad10).
- # Programmable burst length (1,2,4,8) and burst sequence (sequential,interleave) with no latency.
- # Synchronous design for precise control with an external clock (K).
- # Output retention by advanced mask clock (CMs#).
- # All inputs/outputs low capacitance and LVTTTL compatible.
- # Separate DRAM and SRAM address inputs for fast SRAM access.
- # Page Mode capability.
- # Auto Refresh capability.
- # Self Refresh capability.

**NOTES**

- 1) For the DPD function, the RAS#, CAS# and DTD# inputs are DON'T CARE except for the L,L,H combination. (Respectively).
- 2) The unused addresses must be set to Low.
- 3) Use New: If BW or BWT or BWTW is initiated the same cycle as DWT1 or DWT1R, new data is loaded into the buffer and transferred to DRAM.
- 4) Clear 1 or 2 Transfer Mask Bits (as addressed by As0-2 and DQCU/L).

- 5) Actual number of bits transfer depends on the state of the DTBW Mask and the DQCU/DQCL inputs. Note: If DQC(U/L) is Low, the corresponding DQ(s) is(are) disabled (Input and Output Buffer). SR,SW,BR and BW cycles with DQCU and DQCL Low result in a Deselect SRAM operation.
- 6) Following a DWT1 or DWT1R cycle, the entire WB1 Transfer Mask is Set. (i.e., data can no longer be transferred from WB1 to DRAM.) Succeeding Buffer-Writes or Buffer Write Transfers will Clear Mask bits.
- 7) Cmd# during current cycle must be High (see timing diagram for Auto-Refresh).
- 8) Cmd# during current cycle must be Low (see timing diagram for Self-Refresh).

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## PIN DESCRIPTIONS(1)

K	Input	Master Clock Provides the fundamental timing and the internal clock frequency for the CDRAM. All external timing parameters (with the exception of G# in read cycle and Cmd# in Self refresh cycle) are specified with respect to the rising edge of K.
CMd#	Input	DRAM Clock Mask controls the operation of the internal DRAM master clock (K). When CMd# is Low at the rising edge of K, the internal DRAM master clock (K) for the following cycle is ceased and input stages are powered-off, resulting in a DRAM Power Down.
RAS#	Input	Row Address Strobe is used in conjunction with Master clock K (depending on the states of CMd#, CAS#, and DTD#) to activate the DRAM (latching the Row Address lines and accessing 1 of 4096 rows), initiate a DRAM precharge cycle, perform a DRAM Read or Write Transfer, DRAM Write Transfer & Read, set the command registers, start an Auto-Refresh cycle, enter a Self-Refresh cycle, create a DRAM NOP cycle, or power down the DRAM.
CAS#	Input	Column Address Strobe is used in conjunction with the Master Clock K to latch the Column addresses. When preceded by RAS# in a DRAM access cycle, CAS# initiates a DRAM Write Transfer (WB1/2 -> DRAM, if DTD#=L), DRAM Write Transfer & Read (WB1/2 -> DRAM -> RB, if DTD#=L) or DRAM Read Transfer (DRAM -> RB, if DTD#=H), depending on the state of DTD# (see DTD# pin description).
DTD#	Input	Data Transfer Direction controls DRAM-to-RB(read) / WB-to-DRAM (write) direction. If preceded by a RAS# low cycle, both CAS# and DTD# low (on the rising edge of K) initiate a DRAM Write Transfer cycle. If DTD# stays High with the above conditions, a DRAM Read Transfer cycle results. DTD# can also initiate DRAM Activate, DRAM Precharge, Auto-Refresh, Set-Command Register, and Self Refresh cycles.
Ad0-Ad11	Input	DRAM Address Lines are Multiplexed to reduce pin count. Ad0-Ad11 (@ RAS=low,CAS=high,DTD=high, K=Rising edge) specify the Row Address of the DRAM to activate and refresh the selected page and Ad3-Ad7 (@ RAS=high,CAS=low,K=Rising edge) specify the Block Address of the DRAM. In addition, Ad0-Ad2 (@ RAS=high,CAS=low, K=Rising edge) specify the transfer operation of the DRAM. Also Ad0-Ad9 (@RAS=low,CAS=low, DTD=low, K=Rising Edge) are used as the command in set command register cycle.
CS#	Input	The Chip Select controls the operation of the CDRAM. When CS#=H at the rising edge of K and the previous Cmd# or CMs# is high, the chip is in No Operation mode.
CMs#	Input	SRAM Clock Mask controls the operation of the internal SRAM master clock (Ks). When CMs# is asserted at a rising edge of K, the internal SRAM master clock for the following cycle is suspended, resulting in the power down of the SRAM portion of the circuit, including the Sense Amps. CMs# can also be used to retain output data during SRAM power-down.

**M5M4V16169DTP/RT-7,-8,-10,-15**

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

**PIN DESCRIPTIONS(2)**

DQCI,DQCu	Input	DQCu/I are I/OByte control signals. If G#=Low, DQCu/I have a control of output impedance: DQCu controls upper DQs (DQ8-15) & DQCI controls lower DQs (DQ0-7). DQCu/I also control both input data during SRAM Writes or Buffer Writes and transfer mask during Buffer Writes. (WB1 transfer Masks for each byte are written (bits are cleared) during Buffer Writes depending on DQCu/I inputs.)
WE#	Input	Write Enable controls SRAM and Buffer read and write operations. A high on the WE# pin causes either a Buffer Read, SRAM Read, Buffer Read Transfer and/or a Buffer Read Transfer & Read to occur (depending on the state of the CC0# and CC1# bits). A low on the WE# pin causes either a Buffer Write, SRAM Write, Buffer Write Transfer and/or a Buffer Write Transfer & Write to occur (depending on the state of the CC0# and CC1# inputs)
CC0#,CC1#	Inputs	The Control Clock Inputs control SRAM and Buffer operations. CC0# is Low for all Buffer Writes, Reads, and Transfers, and High for all other SRAM operations. CC1# is high for all Buffer Read Transfers and Buffer Write Transfers, and Deselect SRAM.
As0-As9	Inputs	SRAM Addresses are non-multiplexed, and access 1024 - 16-bit words ( configured as 128 Rows X 8 Columns X 16 Bits, where the Block Size is 8 X 16) in the SRAM array. As0-As3 select word address within a block, and As3-As9 select the SRAM row(block).
G#	Input	The Output Enable is an asynchronous input. G#=high forces the outputs to high impedance.
DQ0-DQ15	Inputs / Outputs	Output operation is either transparent, latched, or registered depending on the state of the command register. The Data Lines for the CDRAM are asynchronously controlled by G#.
VccQ	Supply	VccQ is the DQ power supply and allows the device to operate in a mixed voltage system (e.g., 5V data bus). As specified in the Table: Recommended Operating Conditions, VccQ must be greater-than or equal-to the highest voltage experienced by the data bus. For 3.3V system operation, VccQ may be tied to Vcc.

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## MODE DESCRIPTIONS (1)

NOP	No Operation. Outputs are high-impedance. All input buffers remain active.
SRAM Power-Down	If CMs#=Low at the rising edge of K, the SRAM enters SRAM Power Down at the next rising edge of K. During this mode, the internal SRAM K clock becomes inactive. The Output Buffers remain enabled and are controlled by G#. All input buffers of SRAM clocks and SRAM addresses are inactive.
Deselect SRAM	All transfer functions and input/output operations to and from the SRAM and Buffer are disabled. This cycle is useful for output impedance control (Hi-Z,Low-Z) without G#. Output buffers are active during this cycle for registered output mode control.
SRAM Read	Data is read from the SRAM to the I/O pins. Addresses As0-As9 are used to select the data to be read. As3-As9 decode the SRAM Row (=Block), and As0-As2 decode (1 of 8) the 16-bit word. DQCu and DQCI control the impedance (High-Z/Low-Z) of the upper and lower bytes, respectively.
SRAM Write	<p>Data is written from the I/O pins to the SRAM. Addresses As0-As9 are used to select the location to be written. As3-As9 decode the SRAM Row (=Block), and As0-As2 decode (1 of 8) the 16-bit word to be written. DQCUu and DQCI control Upper and Lower byte writes, respectively.</p>  <p>The diagram illustrates the SRAM write path. It shows a DRAM 1MX16 block at the top and an SRAM 1KX16 block at the bottom. The DRAM block includes a DRAM RowDecoder and is divided into 8X16Block units. The SRAM block includes an SRAM RowDecoder and an SRAM Column Decoder. Data is written from the I/O pins (DQs) through two buffers, WB1 and WB2, into the SRAM. The DRAM block also has two buffers, RB1 and RB2. The diagram shows the flow of data from the I/O pins through the buffers and decoders into the DRAM and SRAM blocks. The DRAM block is connected to the SRAM block via a bus. The DRAM block is also connected to the I/O pins via a bus. The SRAM block is connected to the I/O pins via a bus. The diagram shows the flow of data from the I/O pins through the buffers and decoders into the DRAM and SRAM blocks. The DRAM block is connected to the SRAM block via a bus. The DRAM block is also connected to the I/O pins via a bus. The SRAM block is connected to the I/O pins via a bus.</p>

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## MODE DESCRIPTIONS (5)

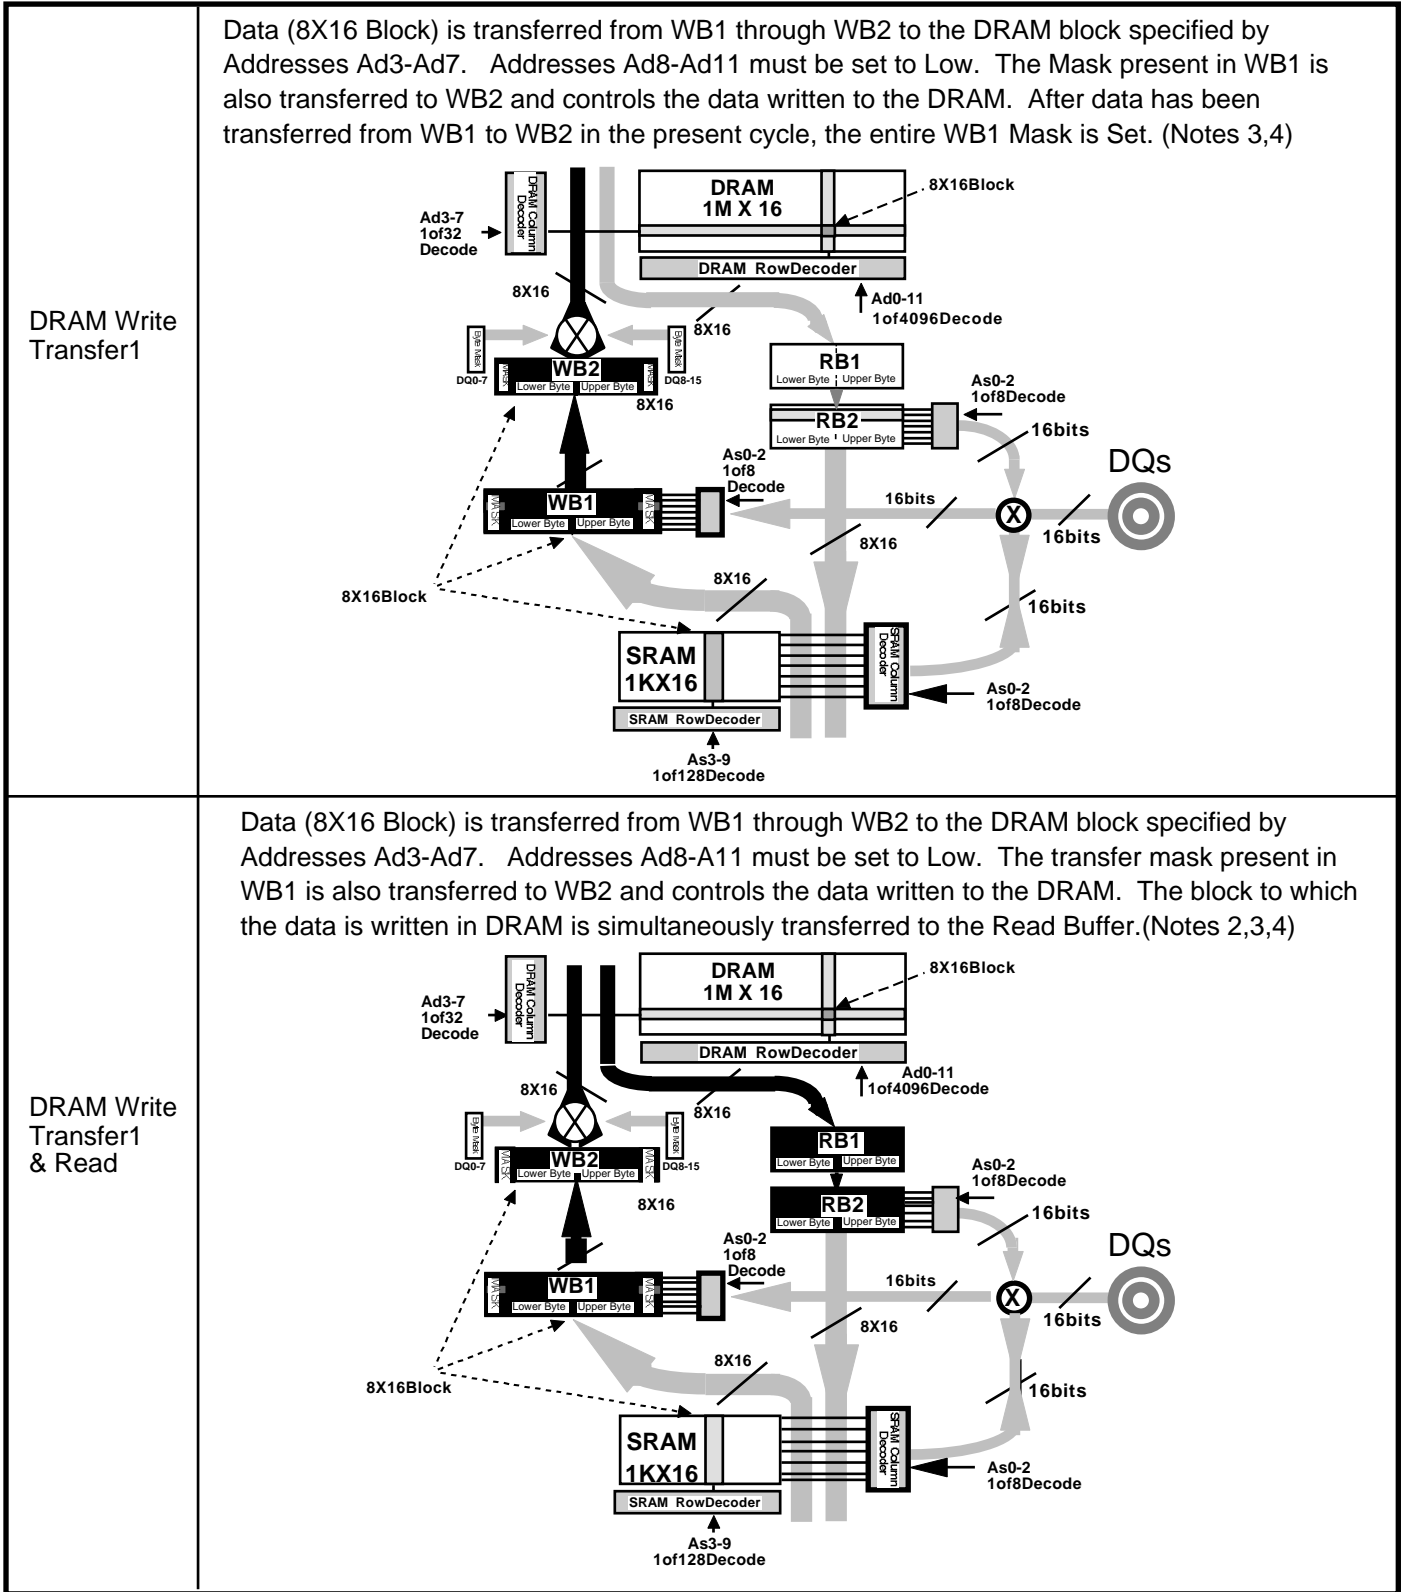

DRAM Power-Down	If Cmd#=Low at the rising edge of K, the DRAM enters DRAM Power Down at the next rising edge of K. During this mode, the internal DRAM K clock becomes inactive. Also all input buffers of DRAM clocks and DRAM addresses are inactive. Note that the latency of DRAM Read Transfer cycle is not counted up in this cycle.
DRAM NOP	The DNOP cycle is used when no other DRAM operations are desired, holding the DRAM in its present (precharge/activate) state.
DRAM Read Transfer	<p>A Block (8x16) is transferred from the DRAM to the Read Buffer1 and 2 (RB1,RB2) as specified by Addresses Ad3-Ad7. Addresses Ad8-Ad11 and Ad0-Ad2 must be set to Low. After the Latency Period (specified in the Access Latency Table) new data will be present in the Read Buffer2. Prior to the Latency timeout, old data will be present in the RB2. (Notes 1,2,4)</p> <p>The diagram illustrates the DRAM Read Transfer process. It shows a DRAM 1M X 16 block with an 8x16 block selected. This data is transferred through a DRAM Row Decoder (Ad0-11, 1of4096Decode) to two Write Buffers (WB1 and WB2) and two Read Buffers (RB1 and RB2). The Write Buffers (WB1 and WB2) are connected to an SRAM 1K X 16 block via SRAM Row Decoders (As3-9, 1of128Decode) and SRAM Column Decoders (As0-2, 1of8Decode). The Read Buffers (RB1 and RB2) are also connected to the SRAM Column Decoders. The data is then transferred to the DQs (Data Queue) via a 16-bit bus. The diagram also shows the internal data paths and the 8x16 block being transferred.</p>

## MODE DESCRIPTIONS (8)

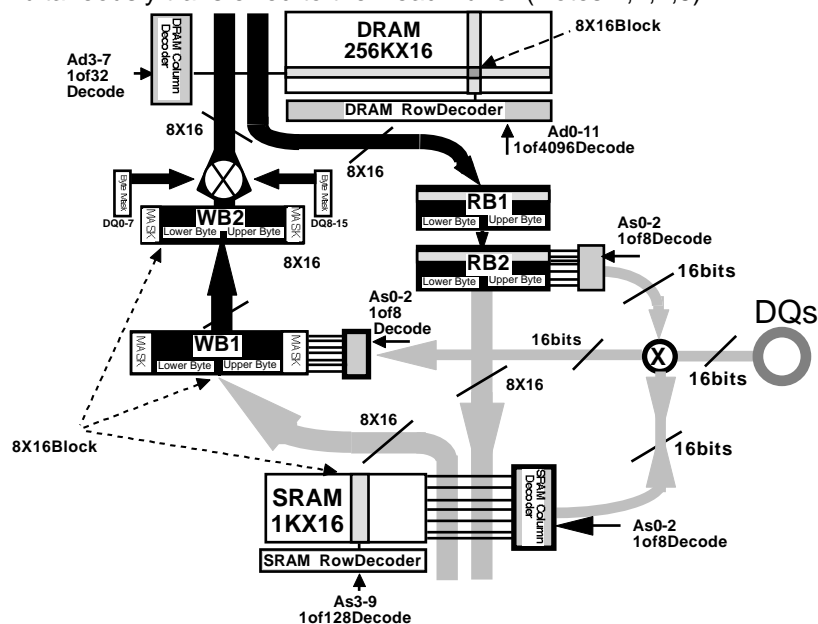

DRAM Write Transfer3

Data (8X16 Block) is transferred from WB1 through WB2 to the DRAM block specified by Addresses Ad3-Ad7. Addresses Ad8-Ad9 must be set to Low. The Mask present in Byte Mask Register controls the data written to the DRAM. The Byte Mask Register is set at Load Byte Mask cycle, where corresponding byte masks are set depending on DQ data in the cycle. (Note 4,5) The data of WB1 and the mask data of WBM1 are transferred to WB2 and WBM2, however WBM1/2 is not used in this cycle.

DRAM Write Transfer3 & Read

Data (8X16 Block) is transferred from WB1 through WB2 to the DRAM block specified by Addresses Ad3-Ad7. Addresses Ad8-Ad9 must be set to Low. The Mask present in Byte Mask Register controls the data written to the DRAM. The block to which the data is written in DRAM is simultaneously transferred to the Read Buffer. (Notes 1,2,4,5)

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## MODE DESCRIPTIONS (10)

DRAM Activate	Addresses are latched from the Ad0-Ad11 inputs by the rising edge of K. Internally, a DRAM row is selected (Page Call) in preparation for a DRAM Read or Write Transfer cycle. A DRAM Precharge cycle must separate all DRAM Activate cycles.
DRAM Precharge	Internally, the active DRAM Row is deselected (completing the refresh process) and page-mode is disabled. The DRAM is precharged prior to another DRAM Activate cycle.
DRAM Auto-Refresh	Internally, a DRAM row is selected and refreshed (as addressed by an internal, self-incrementing counter), followed by an internally generated Precharge cycle. The Auto refresh cycle can be implemented only if the DRAM is in Precharge state (i.e., a Precharge or Auto-Refresh cycle occurred more recently than an Activate cycle). DRAM Auto-Refresh is similar to a CAS-Before-RAS (CBR) mode in standard DRAMs.
DRAM Self Refresh	All clock buffers are suspended, and Cmd# asynchronously controls Self Refresh (Cmd# rising edge initiates exit from Self Refresh). During Self Refresh, device enters a low power mode, with 2048 automatic refresh cycles.
Set Command Register	When SCR is initiated, the addresses present on the Ad0-Ad11 DRAM Address pins determine the DRAM Read Transfer Latency, the Output Mode (transparent / latched / registered), and WB1 transfer mask mode (set-all/ no change). No DRAM operation is executed in this cycle. Refer to the SCR Truth Table for legal Address values. During SCR cycle and the following 3 clock cycles (totally 4 clock cycles), only NOP, DNOP or DPD are allowed in DRAM portion and only NOP, DES or SPD are done in SRAM portion. The set commands are valid at least after the above 4 clocks later and the previous function is not guaranteed to work if it has not been completed. (i.e. DRT, DWT1&R, DWT2&R and SR, BR and BRTR with registered output mode.)

Notes:

- 1) This function is performed in a Latency period specified in the Access Latency Table.
- 2) After the Latency Period (specified in the Access Latency Table) new data will be present in the Read Buffer2. Prior to the Latency timeout, old data will be present in the RB2.
- 3) After data has been transferred from WB1, the entire WB1 Mask is Set.
- 4) Valid Ad0-Ad2 addresses are shown in the FUNCTION TRUTH TABLE.

## Power-On sequence

Before starting normal operation, the following power on sequence is necessary.

- 1) Apply power and maintain stable power (pause) for 500us.
- 2) Perform a precharge (PCG) operation.
- 3) After tRP, perform 8 auto refresh commands (ARF) with adequate interval (tRC).
- 4) Issue set command register (SCR) to initialize the mode register.

After this sequence, the RAM is in idle state and ready for normal operation.

Note that DNOP / DPD and DES / SPD or NOP command will be the stand-by command for the above power sequence.

Vcc must be powered-on at the same time or before VccQ is on.

And Vcc must be powered-off at the same time or after VccQ is off.

# M5M4V16169DTP/RT-7,-8,-10,-15

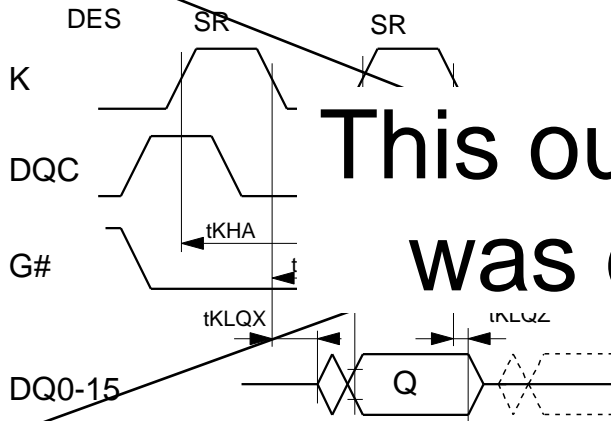

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## Output Operations

Transparent Output appears from the rising edge of K clock.

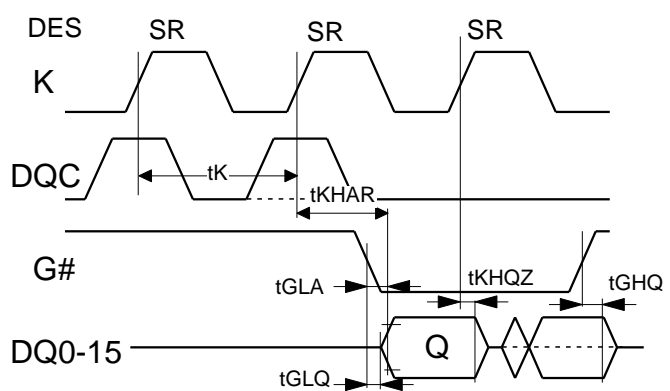

Latched Output appears from the falling edge of K clock.

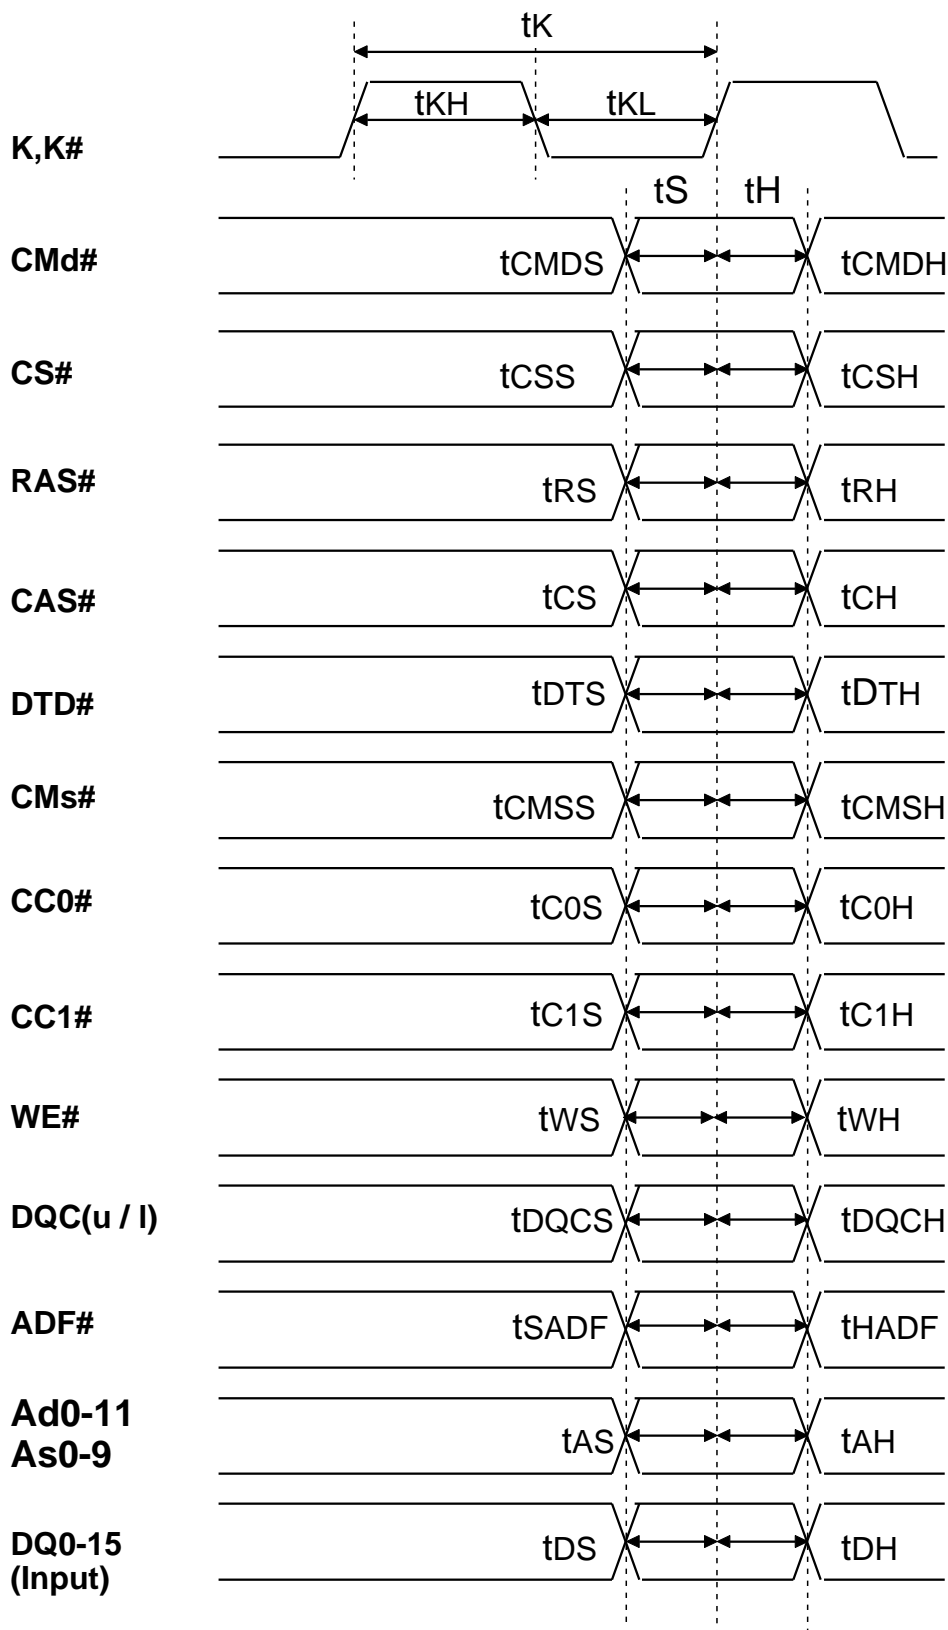

**This output mode was deleted.**

Registered Output appears from the rising edge of K clock.

# M5M4V16169DTP/RT-7,-8,-10,-15

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## Burst Mode (1)

# M5M4V16169DTP/RT-7,-8,-10,-15

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## Burst Mode (2)

Burst address is not incremented by DES, SPD.

"Insert wait" is possible.

ADF#=Low is equal to non-burst mode.

M5M4V16169D keeps compatibility setting ADF# low or setting Burst length=1 by SCR cycle. (Ad7, Ad8 and Ad9=0)

## Set Command Register(2)

Address Input												Command
Ad11	Ad10	Ad9	Ad8	Ad7	Ad6	Ad5	Ad4	Ad3	Ad2	Ad1	Ad0	
L	L				L					L	L	No operation
L	L				L					L	H	Set All WB1 Xfer Masks
L	L				L					L		Default
L	L				L			L	L	L		Output Mode Transparent
L	L				L			L	H	L		<del>Output Mode Latched</del>
L	L				L			H	L	L		Output Mode Registered
L	L				L	L	L			L		Latency 1
L	L				L	L	H			L		Latency 2
L	L				L	H	L			L		Latency 3
L	L				L	H	H			L		Latency 4
L	L				L					L		Default
L	L		L	L	L					L		BL=1
L	L		L	H	L					L		BL=2
L	L		H	L	L					L		BL=4
L	L		H	H	L					L		BL=8
L	L	L			L					L		Sequential
L	L	H			L					L		Interleave
L	L				L					L		Default
L	L				L					L		Default

\* **Latency** is the number of clock cycles required to transfer new data from the DRAM to the Read Buffer . Therefore, it can be adjusted to the clock frequency of the system.  
 (Latency) x (tK) should meet tCBF min. timing requirement.

Inhibit new read or write function during these 4 clocks.

# M5M4V16169DTP/RT-7,-8,-10,-15

16MCDRAM:16M(1M-WORD BY 16-BIT) CACHED DRAM WITH 16K (1024-WORD BY 16-BIT) SRAM

## Burst Mode Address

Initial Address			BL	Sequential							Interleaved								
As2	As1	As0		Y0	Y1	Y2	Y3	Y4	Y5	Y6	Y7	Y0	Y1	Y2	Y3	Y4	Y5	Y6	Y7
0	0	0	8	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
0	0	1		1	2	3	4	5	6	7	0	1	0	3	2	5	4	7	6
0	1	0		2	3	4	5	6	7	0	1	2	3	0	1	6	7	4	5
0	1	1		3	4	5	6	7	0	1	2	3	2	1	0	7	6	5	4
1	0	0		4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3
1	0	1		5	6	7	0	1	2	3	4	5	4	7	6	1	0	3	2
1	1	0		6	7	0	1	2	3	4	5	6	7	4	5	2	3	0	1
1	1	1		7	0	1	2	3	4	5	6	7	6	5	4	3	2	1	0
0	0	0	4	0	1	2	3					0	1	2	3				
-	0	1		1	2	3	0					1	0	3	2				
-	1	0		2	3	0	1					2	3	0	1				
-	1	1		3	0	1	2					3	2	1	0				
-	-	0	2	0	1						0	1							
-	-	1		1	0						1	0							

Note: When SRAM command is executed more than burst length, the Address repeats with the same sequence.
