

Dual 4-channel Analog Multiplexer/Demultiplexer**AZ4052****General Description**

The AZ4052 is high-speed si-gate CMOS device. The AZ4052 is dual 4-channel analog multiplexers or demultiplexers with common select logic. Each multiplexer has four independent inputs/outputs (pins nY0 to nY3) and a common input/output (pin nZ). The common channel select logics include two digital select inputs (pins S0 and S1) and an active LOW enable input (pin \bar{E}). When pin \bar{E} =LOW, one of the four switches is selected (Low-impedance On-state) with pins S0 and S1. When pin \bar{E} =HIGH, all switches are in the high-impedance Off-state, independent of pins S0 and S1. V_{CC} and GND are the supply voltage pins for the digital control inputs (pins S0, S1 and \bar{E}). The V_{CC} to GND ranges are 3.0V to 10V. The analog inputs/outputs (pins nY0 to nY3 and nZ) can swing between V_{CC} as a positive limit and V_{EE} as a negative limit. $V_{CC}-V_{EE}$ may not exceed 10V. For operation as a digital multiplexer/demultiplexer, V_{EE} is connected to GND (Typically Ground).

The AZ4052 is available in standard packages of SOIC-16 and DIP-16.

| Operating Junction Temperature Range | T _J | | 150 | °C |
| Power Dissipation Per Switch | P _S | | 100 | mW |
| ESD (Machine Model) | | | 200 | V |
| ESD (Human Body Model) | | | 2000 | V |

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: To avoid drawing V_{CC} current out of pins nZ, when switch current flows in pins nYn, the voltage drop across the bidirectional switch must not exceed 0.4V. If the switch current flows into pins nZ, no V_{CC} current will flow out of pins nYn. In this case there is no limit for the voltage drop across the switch, but the voltages at pins nYn and nZ may not exceed V_{CC} or V_{EE}.

Note 3: Above 70°C derate linearly with 12mW/K (DIP-16 package).

Above 70°C derate linearly with 8mW/K (SOIC-16 package)
