Description

PI4ULS3V08, is a 8-bit (octal) non-inverting bus transceiver with two separate supply rails: A port (V_{CCA}) and B port (V_{CCB}) are set to operate at 1.2V to 3.6V. This arrangement permits universal bidirectional translation of differential signal levels over the voltage ranges.

The PI4ULS3V08 is designed for asynchronous communication between data buses. Data is transmitted from the A bus to the B bus, or vice versa, without direction control. All A_X, and B_X are tri-stated when data is coming from both directions at the same time. The output-enable ($\overline{OE}$) input is used to disable outputs so buses are isolated.
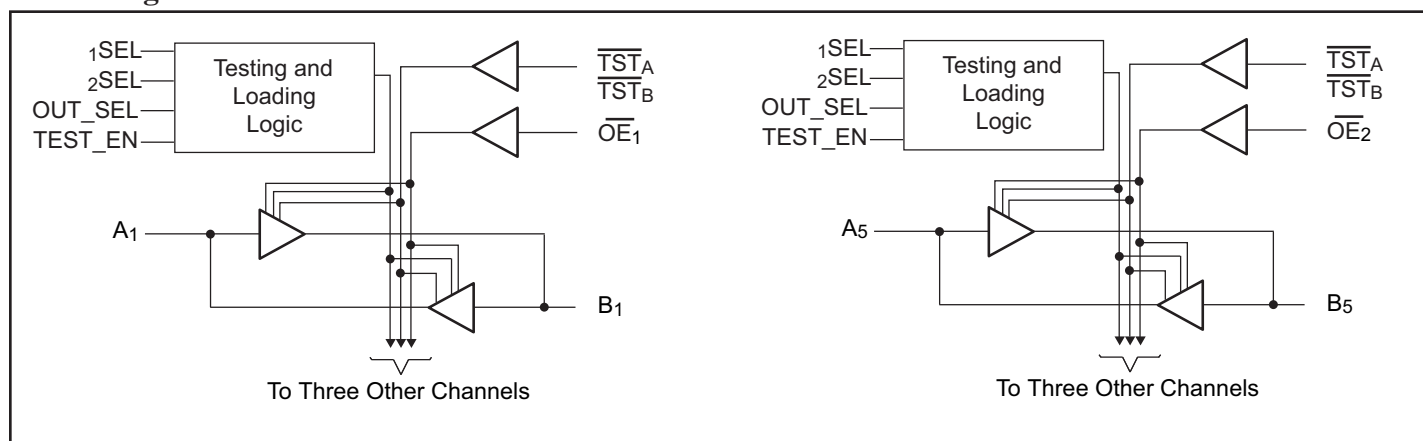

The control pins, $_x$SEL, $\overline{OE}$x, TEST_EN and OUT_SEL are supplied by V_{CCB}.

To ensure the high impedance state during power-up or power-down, the output-enable ($\overline{OE}$) input should be tied to V_{CC} through a pullup resistor: the minimum value of the resistor is determined by the current-sinking capability of the driver.
