IS31AP2111

2×20W STEREO DIGITAL AUDIO AMPLIFIER WITH 20 BANDS EQ FUNCTIONS

Preliminary Information
September 2014

GENERAL DESCRIPTION

IS31AP2111 is a digital audio amplifier capable of driving a pair of 8Ω, 20W operating at 24V supply without external heat-sink or fan requirement with play music.

IS31AP2111 can provide advanced audio processing capabilities, such as volume control, 20 bands speaker EQ, audio mixing, 3D surround and Dynamic Range Control (DRC). These functions are fully programmable via a simple I2C control interface.

Robust protection circuits are provided to protect IS31AP2111 from damage due to accidental erroneous operating condition. IS31AP2111 is more tolerant to noise and PVT (Process, Voltage, and Temperature) variation than the analog Class-AB or Class-D audio amplifier counterpart implemented by analog circuit design. IS31AP2111 is pop free during instantaneous power switch because of its built-in, robust anti-pop circuit.

APPLICATIONS

- TV audio
- Boom-box, CD and DVD receiver, docking system
- Powered speaker
- Wireless audio

FEATURES

- 16/18/20/24-bits input with I2S, Left-alignment and Right-alignment data format
- PSNR & DR (A-weighting)
  Loudspeaker: 99dB (PSNR), 104dB (DR) @24V
- Multiple sampling frequencies (F_S)
  - 32kHz / 44.1kHz / 48kHz and
  - 64kHz / 88.2kHz / 96kHz and
  - 128kHz / 176.4kHz / 192kHz
- System clock = 64x, 128x, 192x, 256x, 384x, 512x, 576x, 768x, 1024x Fs
  - 64x~1024x F_S for 32kHz / 44.1kHz / 48kHz
  - 64x~512x F_S for 64kHz / 88.2kHz / 96kHz
  - 64x~256x F_S for 128kHz / 176.4kHz / 192kHz
- Supply voltage
  - 3.3V for digital circuit
  - 10V~26V for loudspeaker driver
- Loudspeaker output power for at 24V
  - 10W × 2CH into 8Ω @0.24% THD+N for stereo
  - 20W × 2CH into 8Ω @0.38% THD+N for stereo
- Sound processing including:
  - 20 bands parametric speaker EQ
  - Volume control (+24dB ~ -103dB, 0.125dB/step),
  - Dynamic range control (DRC)
  - Dual band dynamic range control
  - Power clipping
  - 3D surround sound
  - Channel mixing
  - Noise gate with hysteresis window
  - Bass/Treble tone control
  - DC-blocking high-pass filter
- Anti-pop design
- Short circuit and over-temperature protection
- I2C control interface with selectable device address
- Support hardware and software reset
- Internal PLL
- LV Under-voltage shutdown and HV Under-voltage detection
- Power saving mode

TYPICAL APPLICATION CIRCUIT

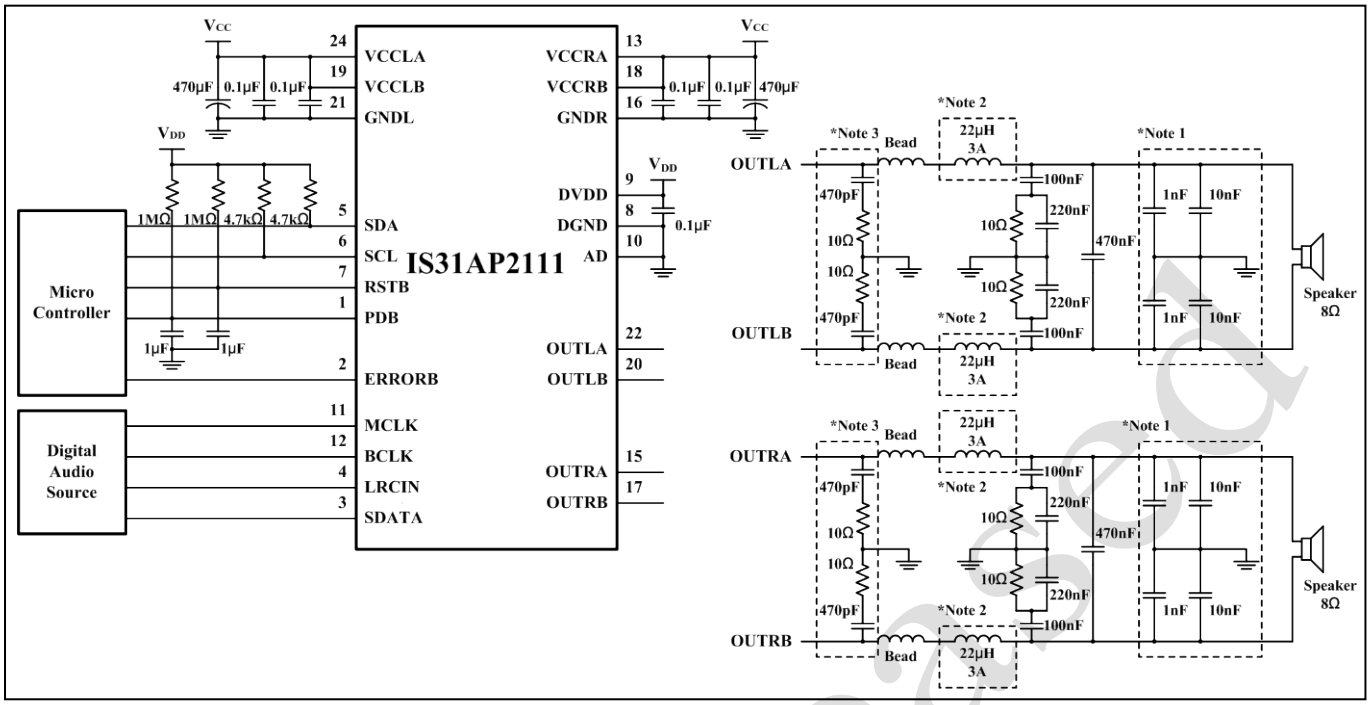

Figure 1 Typical Application Circuit (for BTL Stereo, Single-ended Input)

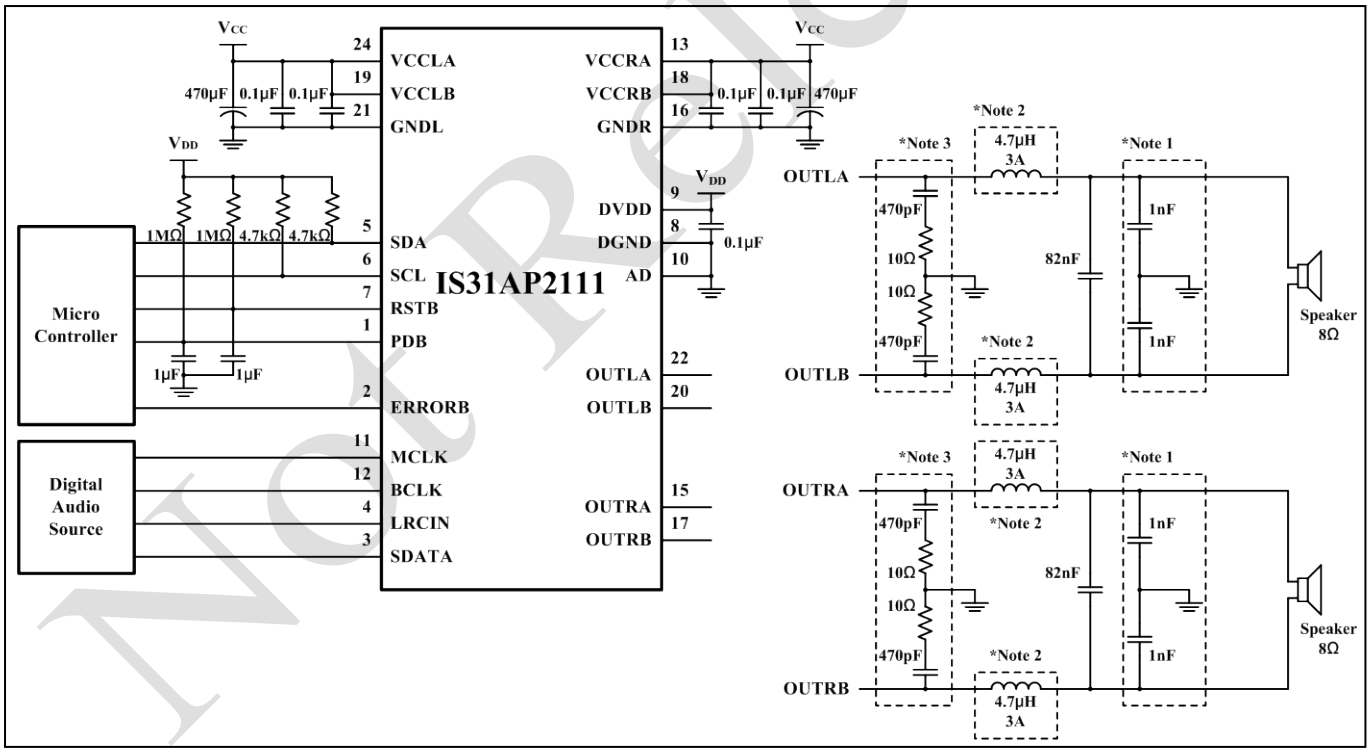

Figure 2 Typical Application Circuit (Economic Type, Moderate EMI Suppression)

Note 1: These capacitors should be placed as close to speaker jack as possible, and their values should be determined according to EMI test results.

Note 2: When concerning about short-circuit protection, it is suggested using the choke with its I_{DC} larger than 5A.

Note 3: The snubber circuit can be removed while the V_{CC} ≤20V.

Note:

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

APPLICATIONS INFORMATION

OPERATION MODES

Without I2C Control

The default settings, Bass, Treble, EQ, Volume, DRC, …, and PLL are applied to register table content when using IS31AP2111 without I2C control. The more information about default settings, please refer to the highlighted column of register table section.

With I2C Control

When using I2C control, user can program suitable parameters into IS31AP2111 for their specific applications. Please refer to the register table section to get the more detail.

INTERNAL PLL

IS31AP2111 has a built-in PLL internally. The MCLK/F_S ratio will be fixed at 1024x, 512x, or 256x with a sample frequency of 48kHz, 96kHz, or 192kHz respectively. A career clock frequency is the frequency divided by 128 of master clock.

Table 1 MCLK/F_S Ratio

F_S	MCLK Frequency
48kHz	49.152MHz
44.1kHz	45.158MHz
32kHz	32.768MHz

DEFAULT VOLUME

The default volume level of IS31AP2111 is +1.675dB, the default volume register table setting is muted. Please give a de-mute command via I2C when the whole system is stable. About the more detailed information, please refer to the register table section.

RESET

When the RSTB pin is lowered, IS31AP2111 will clear the stored data and reset the register table to default values. IS31AP2111 will exit reset state at the 256th MCLK cycle after the RSTB pin is raised to high.

POWER DOWN CONTROL

IS31AP2111 has a built-in volume fade-in/fade-out design for power down and mute function. The relative power down timing diagrams for loudspeakers are shown below.

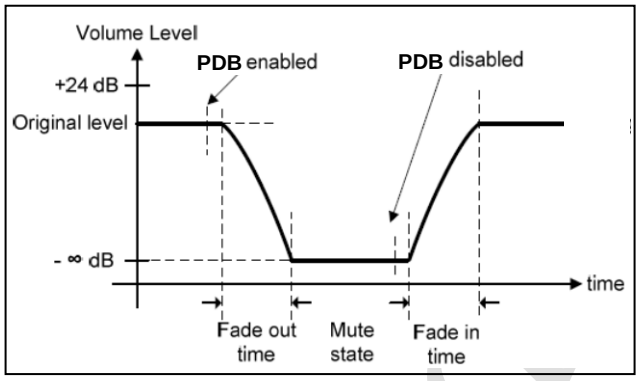

Figure 18 Power Down Timing Diagrams With Mute

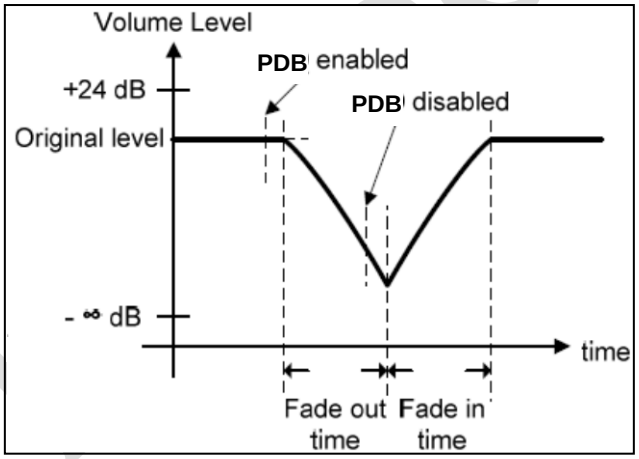

Figure 19 Power Down Timing Diagrams

$$t_{FADE} = \left| 10^{\frac{Target(dB)}{20}} - 10^{\frac{Original(dB)}{20}} \right| \times 128 \times (1/96kHz)$$

The volume level will be decreased to -∞dB in several LRCIN cycles. Once the fade-out procedure is finished, IS31AP2111 will turn off the power stages, stop clock signals (MCLK, BCLK) from feeding into digital circuit and turn off the current of the internal analog circuits. After PDB pin is pulled low, IS31AP2111 needs t_{FADE} time to finish the above works before entering power down state. Users can't program IS31AP2111 during power down state, but all the settings of register table will still be kept except that DVDD is removed.

If the power down function is disabled in the midway of the fade-out procedure, IS31AP2111 will also execute the fade-in procedure. In addition, IS31AP2111 will establish the analog circuits' bias current and feed the clock signals (MCLK, BCLK) into digital circuits. Then, IS31AP2111 will return to its normal operation without power down.

SELF-PROTECTION CIRCUITS

IS31AP2111 has built-in protection circuits including thermal, short-circuit and under-voltage detection circuits.

Thermal Protection

When the internal junction temperature is higher than 158°C, power stages will be turned off and IS31AP2111 will return to normal operation once the temperature drops to 125°C. The temperature values may vary around 10%.

Short-Circuit Protection

The short-circuit protection circuit protects the output stage when the wires connected to loudspeakers are shorted to each other or GND/VDD. For normal 24V operations, the current flowing through the power stage will be less than 5.1A for stereo configuration. Otherwise, the short-circuit detectors may pull the ERRORB pin to DGND, disabling the output stages. When the over-temperature or short-circuit condition occurs, the open-drain ERRORB pin will be pulled low and latched into ERROR state.

Once the over-temperature or short-circuit condition is removed, IS31AP2111 will exit ERROR state when one of the following conditions is met: (1) RSTB pin is pulled low. (2) PDB pin is pulled low. (3) Master mute is enabled through the I2C interface.

Under-Voltage Protection

Once the V_{DD} voltage is lower than 2.8V, IS31AP2111 will turn off its loudspeaker power stages and cease the operation of digital processing circuits. When V_{DD} becomes larger than 2.9V, IS31AP2111 will return to normal operation.

ANTI-POP DESIGN

IS31AP2111 will generate appropriate control signals to suppress pop sounds during initial power on/off, power down/up, mute, and volume level changes.

3D SURROUND SOUND

IS31AP2111 provides the virtual surround sound technology with greater separation and depth voice quality for stereo signals.

POWER ON SEQUENCE

Hereunder is IS31AP2111's power on sequence. Please note that IS31AP2111 default volume setting is muted initially. Please give a de-mute command via I2C when the whole system is stable.

I2C-BUS TRANSFER PROTOCOL

INTRODUCTION

IS31AP2111 employs I2C-bus transfer protocol. Two wires, serial data and serial clock carry information between the devices connected to the bus. Each device is recognized by a unique 7-bit address and can operate as either a transmitter or a receiver. The master device initiates a data transfer and provides the serial clock on the bus. IS31AP2111 is always an I2C slave device.

PROTOCOL

START And STOP Condition

START is identified by a high to low transition of the SDA signal. A START condition must precede any command for data transfer. A STOP is identified by a low to high transition of the SDA signal. A STOP condition terminates communication between IS31AP2111 and the master device on the bus. In both START and STOP, the SCL is stable in the high state.

Data Validity

The SDA signal must be stable during the high period of the clock. The high or low change of SDA only occurs when SCL signal is low. IS31AP2111 samples the SDA signal at the rising edge of SCL signal.

Device Addressing

The master generates 7-bit address to recognize slave devices. When IS31AP2111 receives 7-bit address matched with 0110x00 (where x can be selected by external AD pin, respectively), IS31AP2111 will acknowledge at the 9th bit (the 8th bit is for R/W bit). The bytes following the device identification address are for IS31AP2111 internal sub-addresses.

Data Transferring

Each byte of SDA signaling must consist of 8 consecutive bits, and the byte is followed by an acknowledge bit. Data is transferred with MSB first, as shown in the figure below. In both write and read operations, IS31AP2111 supports both single-byte and multi-byte transfers. Refer to the figure below for detailed data-transferring protocol.

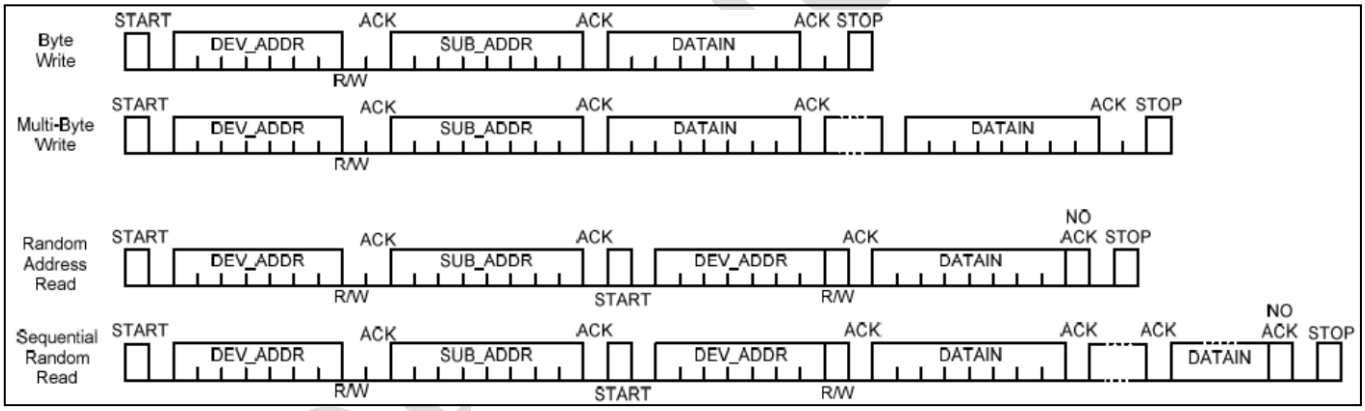

Figure 22 Data Transferring

REGISTER DEFINITIONS

The IS31AP2111's audio signal processing data flow is shown below. Users can control these functions by programming appropriate settings in the register table. In this section, the register table is summarized first. The definition of each register follows in the next section.

IS31AP2111 supports both master-volume (03h Register) and channel-volume control (04h, 05h and 06h Registers) modes. Both volume control settings range from +12dB ~ -103dB and 0.5dB per step. Note that the master volume control is added to the individual channel volume control as the total volume control. For example, if the master volume level is set at, Level A (in dB unit) and the channel volume level is set at Level B (in dB unit), the total volume control setting is equal to Level A plus with Level B. -103dB ≦ Total volume (Level A + Level B) ≦ +24dB.

If the PWM exceeds the programmed switching power level (default 26×40ns), the modulation algorithm will change from quaternary into power saving mode. It results in higher power efficiency during larger power output operations. If the PWM drops below the programmed switching power level - power saving mode hysteresis window, the

modulation algorithm will change back to quaternary modulation.

RAM ACCESS

The procedure to read/write coefficient(s) from/to RAM is as followings:

Read A Single Coefficient From RAM:

1. Write 7-bit of address to I2C address-0X14
2. Write 1 to R1 bit in address-0X24
3. Read top 8-bits of coefficient in I2C address-0X15
4. Read middle 8-bits of coefficient in I2C address-0X16
5. Read bottom 8-bits of coefficient in I2C address-0X17

Read A Set Of Coefficients From RAM:

1. Write 7-bits of address to I2C address-0X14
2. Write 1 to RA bit in address-0X24
3. Read top 8-bits of coefficient A1 in I2C address-0X15
4. Read middle 8-bits of coefficient A1in I2C address-0X16
5. Read bottom 8-bits of coefficient A1 in I2C address-0X17
6. Read top 8-bits of coefficient A2 in I2C address-0X18
7. Read middle 8-bits of coefficient A2 in I2C address-0X19
8. Read bottom 8-bits of coefficient A2 in I2C address-0X1A
9. Read top 8-bits of coefficient B1 in I2C address-0X1B
10. Read middle 8-bits of coefficient B1 in I2C address-0X1C
11. Read bottom 8-bits of coefficient B1 in I2C address-0X1D
12. Read top 8-bits of coefficient B2 in I2C address-0X1E
13. Read middle 8-bits of coefficient B2 in I2C address-0X1F
14. Read bottom 8-bits of coefficient B2 in I2C address-0X20
15. Read top 8-bits of coefficient A0 in I2C address-0X21
16. Read middle 8-bits of coefficient A0 in I2C address-0X22
17. Read bottom 8-bits of coefficient A0 in I2C address-0X23

Write A Single Coefficient From RAM:

1. Write 7-bis of address to I2C address-0X14
2. Write top 8-bits of coefficient in I2C address-0X15
3. Write middle 8-bits of coefficient in I2C address-0X16
4. Write bottom 8-bits of coefficient in I2C address-0X17
5. Write 1 to W1 bit in address-0X24

Write A Set Of Coefficients From RAM:

1. Write 7-bits of address to I2C address-0X14
2. Write top 8-bits of coefficient A1 in I2C address-0X15
3. Write middle 8-bits of coefficient A1 in I2C address-0X16
4. Write bottom 8-bits of coefficient A1 in I2C address-0X17
5. Write top 8-bits of coefficient A2 in I2C address-0X18
6. Write middle 8-bits of coefficient A2 in I2C address-0X19
7. Write bottom 8-bits of coefficient A2 in I2C address-0X1A
8. Write top 8-bits of coefficient B1 in I2C address-0X1B
9. Write middle 8-bits of coefficient B1 in I2C address-0X1C
10. Write bottom 8-bits of coefficient B1 in I2C address-0X1D
11. Write top 8-bits of coefficient B2 in I2C address-0X1E
12. Write middle 8-bits of coefficient B2 in I2C address-0X1F
13. Write bottom 8-bits of coefficient B2 in I2C address-0X20
14. Write top 8-bits of coefficient A0 in I2C address-0X21
15. Write middle 8-bits of coefficient A0 in I2C address-0X22
16. Write bottom 8-bits of coefficient A0 in I2C address-0X23
17. Write 1 to WA bit in address-0X24

Note: the read and write operation on RAM coefficients works only if LRCIN (Pin 15) switching on rising edge. And, before each writing operation, it is necessary to read the address-0X24 to confirm whether RAM is writable current in first. If the logic of W1 or WA is high, the coefficient writing is prohibited.

USER-DEFINED EQUALIZER

The IS31AP2111 provides 18 parametric Equalizer (EQ). Users can program suitable coefficients via I2C control interface to program the required audio band frequency response for every EQ. The transfer function

$$H_{(z)} = \frac{A_0 + A_1 z^{-1} + A_2 z^{-2}}{1 + B_1 z^{-1} + B_2 z^{-2}}$$

The data format of 2's complement binary code for EQ coefficient is 3.21. i.e., 3-bits for integer (MSB is the sign bit) and 21-bits for mantissa. Each coefficient range is from 0x800000 (-4) to 0x7FFFFF (+3.999999523). These coefficients are stored in User Defined RAM and are referenced in following manner:

CHxEQyA0=A0

CHxEQyA1=A1

CHxEQyA2=A2

CHxEQyB1=-B1

CHxEQyB2=-B2

Where *x* and *y* represents the number of channel and the band number of EQ equalizer.

All user-defined filters are path-through, where all coefficients are defaulted to 0 after being powered up, except the A0 that is set to 0x200000 which represents 1.

MIXER

The IS31AP2111 provides mixers to generate the extra audio source from the input left and right channels. The coefficients of mixers are defined in range from 0x800000 (-1) to 0x7FFFFF (0.9999998808). The function block diagram is as following figure:

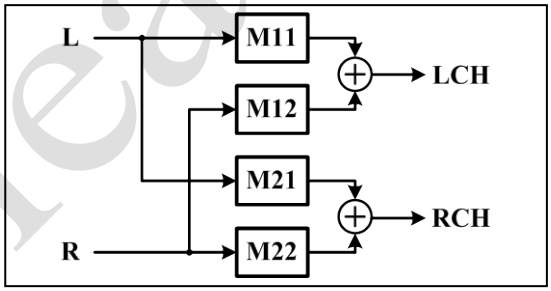

Figure 23 Mixer Function Block Diagram

PRE-SCALE

For each audio channel, IS31AP2111 can scale input signal level prior to EQ processing which is realized by a 24-bit signed fractional multiplier. The pre-scale factor, ranging from -1 (0x800000) to 0.9999998808 (0x7FFFFF), for this multiplier, can be loaded into RAM. The default values of the pre-scaling factors are set to 0x7FFFFF. Programming of RAM is described in RAM access.

POST-SCALE

The IS31AP2111 provides an additional multiplication after equalizing and before interpolation stage, which is realized by a 24-bit signed fractional multiplier. The post-scaling factor, ranging from -1 (0x800000) to 0.9999998808 (0x7FFFFF), for this multiplier, can be loaded into RAM. The default values of the post-scaling factors are set to 0x7FFFFF. All channels can use the channel-1 post-scale factor by setting the post-scale link. Programming of RAM is described in RAM access.

POWER CLIPPING

The IS31AP2111 provides power clipping function to avoid excessive signal that may destroy loud speaker. The power clipping level is defined by 24-bit representation and is stored in RAM address 0X6F and 0X70. The following table shows the power clipping level's numerical representation.

Table 26 Sample Calculation For Power Clipping

ATTACK THRESHOLD FOR DYNAMIC RANGE CONTROL (DRC)

The IS31AP2111 provides dynamic range control (DRC) function. When the input exceeds the programmable attack threshold value, the output power will be limited by this threshold power level via gradual gain reduction. Attack threshold is defined by 24-bit representation and is stored in RAM address 0X71 and 0X72.

RELEASE THRESHOLD FOR DYNAMIC RANGE CONTROL (DRC)

After IS31AP2111 has reached the attack threshold, its output power will be limited to that level. The output power level will be gradually adjusted to the programmable release threshold level. Release threshold is defined by 24-bit representation and is stored in RAM address 0X73 and 0X74. The following table shows the attack and release threshold's numerical representation.

Table 27 Sample Calculation For Attack And Release Threshold

(V_{CC}^2)/R ×L	x	L= $10^{(x/10)}$	D= 2097152×L	H= dec2hex(D)

To best illustrate the dynamic range control, please refer to the following figure.

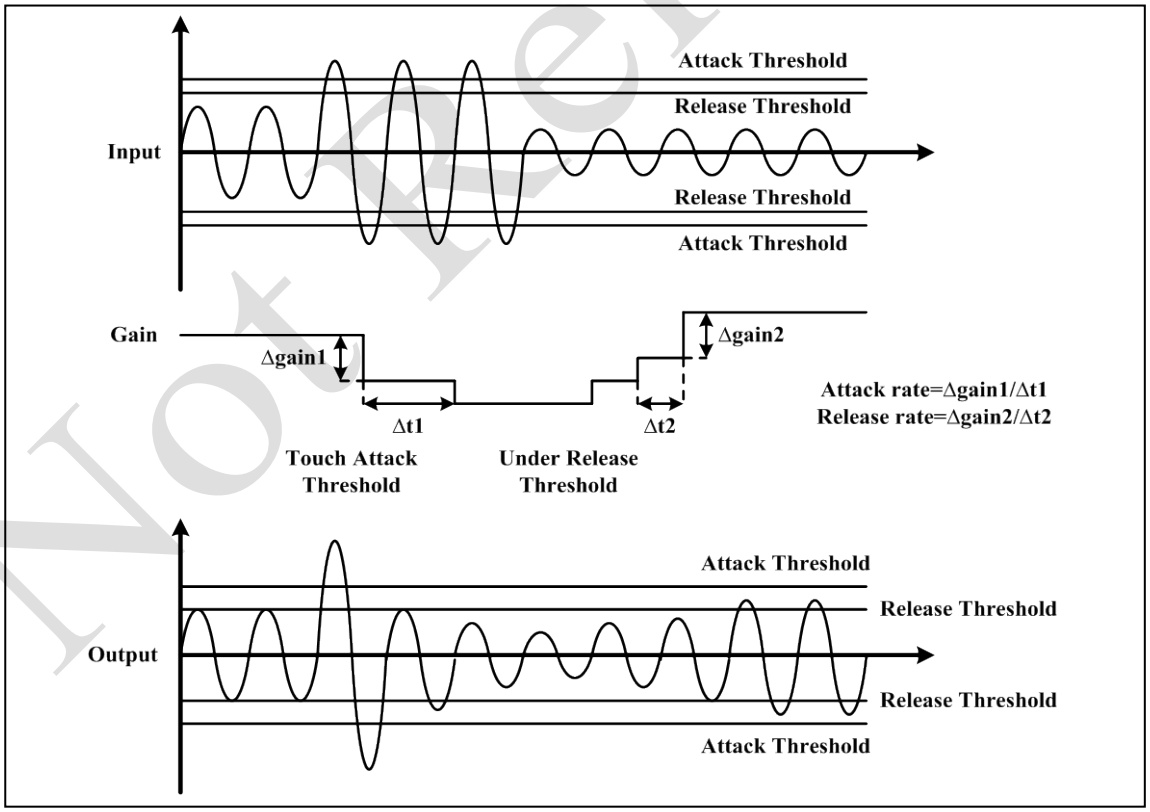

Figure 24 Attack And Release Threshold

NOISE GATE ATTACK LEVEL

When both left and right signals have 2048 consecutive sample points less than the programmable noise gate attack level, the audio signal will multiply noise gate gain, which can be set at x1/8, x1/4, x1/2, or zero if the noise gate function is enabled. Noise gate attack level is defined by 24-bit representation and is stored in RAM address 0X75.

NOISE GATE RELEASE LEVEL

After entering the noise gating status, the noise gain will be removed whenever IS31AP2111 receives any input signal that is more than the noise gate release level. Noise gate release level is defined by 24-bit representation and is stored in RAM address 0X76. The following table shows the noise gate attack and release threshold level's numerical representation.

DRC ENERGY COEFFICIENT

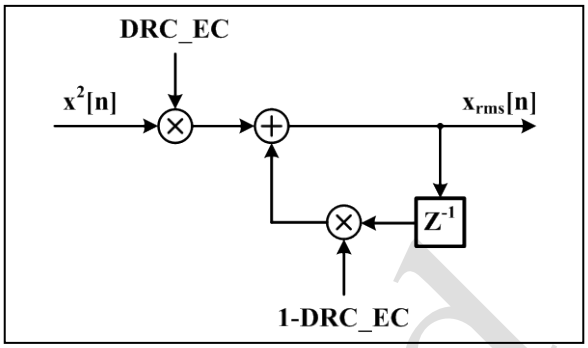

Figure 25 Digital Processing Of Calculating RMS Signal Power

The above figure illustrates the digital processing of calculating RMS signal power. In this processing, a DRC energy coefficient is required, which can be programmed for different frequency range. Energy coefficient is defined by 24-bit representation and is stored in RAM address 0X77 and 0X78. The following table shows the DRC energy coefficient numerical representation.

Table 29 Sample Calculation For DRC Energy Coefficient

CLASSIFICATION REFLOW PROFILES

Profile Feature	Pb-Free Assembly
Preheat & Soak Temperature min (Tsmin) Temperature max (Tsmax) Time (Tsmin to Tsmax) (ts)	150°C 200°C 60-120 seconds
Average ramp-up rate (Tsmax to Tp)	3°C/second max.
Liquidous temperature (TL) Time at liquidous (tL)	217°C 60-150 seconds
Peak package body temperature (Tp)*	Max 260°C
Time (tp)** within 5°C of the specified classification temperature (Tc)	Max 30 seconds
Average ramp-down rate (Tp to Tsmax)	6°C/second max.
Time 25°C to peak temperature	8 minutes max.
