Low Consumption and High Accuracy Shunt Regulator Built-in

High Efficiency and Low Standby Power, CCM corresponding Secondary Side Synchronous Rectification Controller IC

BM1R00xxxF

General Description

BM1R00xxxF is a synchronous rectification controller to be used in the secondary-side output. It has a built-in ultra-low consumption and high accuracy shunt regulator, which significantly reduces standby power. The shunt regulator is constructed in a completely independent chip that enables it to operate as a GND reference even when used in high side.

At continuous mode operation, further space saving can be realized when operating without the input switching synchronizing signal of the primary side.

BM1R00xxxF also features a wide operating power supply voltage range of 2.7V to 32V for various output applications.

Finally, by adopting the high-voltage 120V process, it is possible to monitor the drain voltage directly.

Features

- Built-in Ultra-Low Consumption Shunt Regulator Reducing Standby Power Consumption
- Synchronous Rectification FET Supports High and Low Side
- 120V High Voltage Process DRAIN terminal
- Wide Input Operating Voltage Range of 2.7V to 32V
- Supports LLC and PWM QR Controller
- No Input Required on the Primary-Side at CCM
- Built-in Overvoltage Protection for SH_IN and SH_OUT Terminal
- Built-in Thermal Shutdown Function
- Built-in Auto Shutdown Function
- SOP8 package

Applications

- AC-DC Output Power Conversion Applications: Charger, Adapter, TV, Rice Cooker, Humidifier, Air Conditioning, Vacuum Cleaner, etc.

Key Specifications

- Input Voltage Range: 2.7V to 32V
- Circuit Current (No Switching):   800µA(Typ)
- Circuit Current (Auto Shutdown) :   120µA (Typ)
- DRAIN Terminal Absolute Voltage: 120V
- Operating Temperature Range: -40°C to +105°C

Package

W(Typ) x D(Typ) x H(Max)
5.00mm x 6.20mm x 1.71mm

SOP8

4	SH_GND	Shunt regulator ground
5	MAX_TON	Set maximum on time
6	GATE	Gate drive
7	SR_GND	Synchronous rectification ground
8	DRAIN	DRAIN monitor

Block Diagram

BM1R00001-030: Include Timer LATCH
BM1R00121-150: Without Timer LATCH
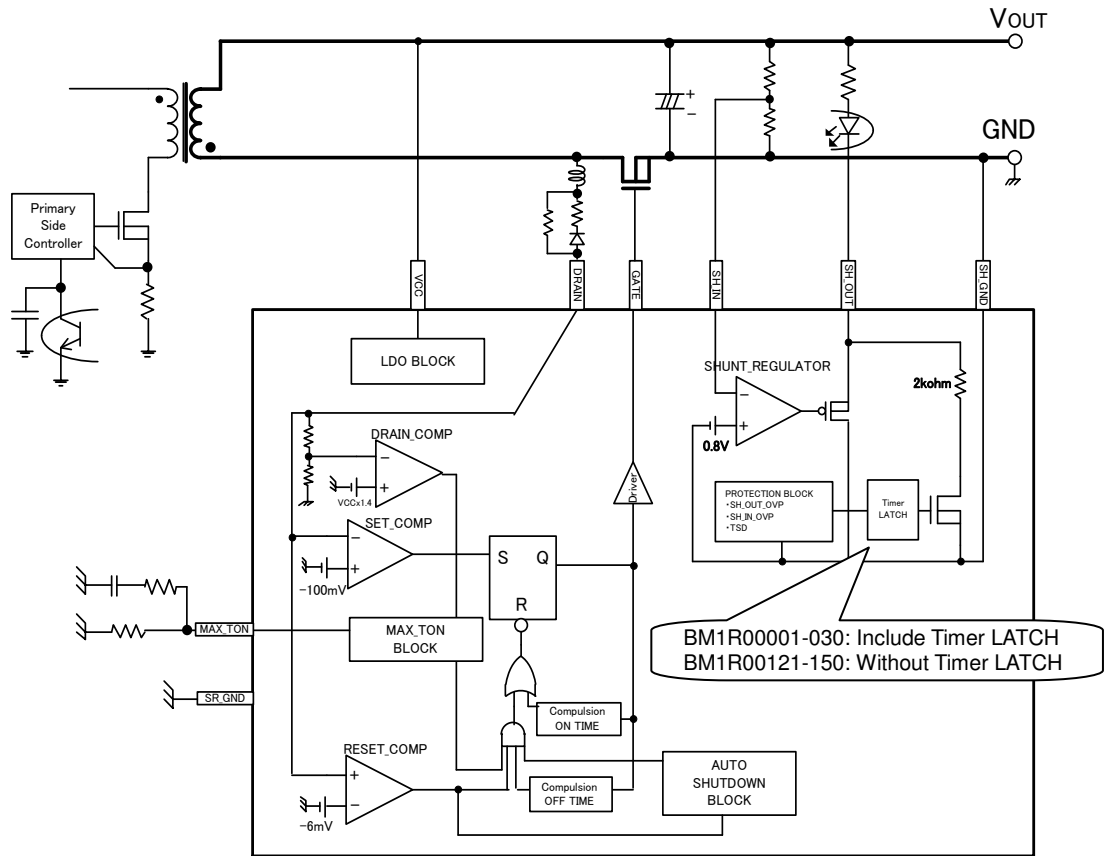

Description of Block

1. **SET_COMP Block**
   Monitors the DRAIN terminal voltage, and outputs a signal to turn ON the FET if the DRAIN terminal voltage is less than or equal to -100mV (Typ).

2. **RESET_COMP Block**
   Monitors the DRAIN terminal voltage and outputs a signal to turn OFF the FET if the DRAIN terminal voltage is more than or equal to -6mV (Typ).

3. **Compulsion ON TIME Block**
   When the FET is turned ON due to SET_COMP detection, noise occurs on the DRAIN terminal. To prevent the noise from turning OFF the FET, an ON state should be forced for a certain time. Compulsion ON time is within a range of 0µs (None) to 3.5µs, which is different for each series number (refer to page.1 table).

4. **Compulsion OFF TIME Block**
   When the FET is turned OFF due to RESET_COMP detection, resonance waveforms appear on the DRAIN terminal. To prevent the noise from turning ON the FET, an OFF state should be forced for a certain time. Compulsion OFF time is within a range of 1.3µs to 4.6µs, which is different for each series number (refer to page.1 table).

   Operation sequence of each block is shown on the figure below**.**

Figure 1. Operation sequence

About Maximum Input Frequency

The Maximum Operating Frequency of the IC depends on the Compulsion ON/OFF Time. For example, BM1R00026F and BM1R00146F Compulsion ON and OFF Time is both equal to 0µs. Considering a variation of 9%, the maximum input frequency is given by the following:

$$f_{MAX} = 1 / ((0µs + 1.3µs) \times 1.09) = 706kHz$$

However, since the frequency varies greatly due to the input voltage and load, it will be necessary to select the series in accordance with each application.

20. Apr. 2016 Rev.002

Description of Block – continued

5. MAX_TON Block

MAX_TON block sets the maximum ON time. DRAIN terminal voltage starts counting when the rising edge of the output voltage exceeds $V_{CC} \times 1.4V$ (Typ). In addition, the recounting starts when it detects another rising edge. The synchronous rectification FET will be forced OFF after the set time has elapsed. The time can be adjusted by varying the resistance value of the resistor connected to the MAX_TON terminal.

The relationship between the resistance value (R_{MAX_TON}) and set time (T_{MAX_TON}) is described as follows:

$$R_{MAX\_TON}(k\Omega) = t_{MAX\_TON}(\mu s) \times 10(k\Omega/\mu s)$$

Calculation Example:
If you want to set the maximum ON time to 10µs, the value of R_{MAX_TON} is as follows:

$$10\mu s \times 10(k\Omega/\mu s) = 100k\Omega$$

However, the formula above is for an ideal approximation only; it is still strongly advised that the operation of the actual application should still be verified.

By setting this time, it becomes possible to prevent the simultaneous ON operation of the primary side and the secondary side in continuous mode.

The drive sequence in continuous mode operation is shown in the figure below:

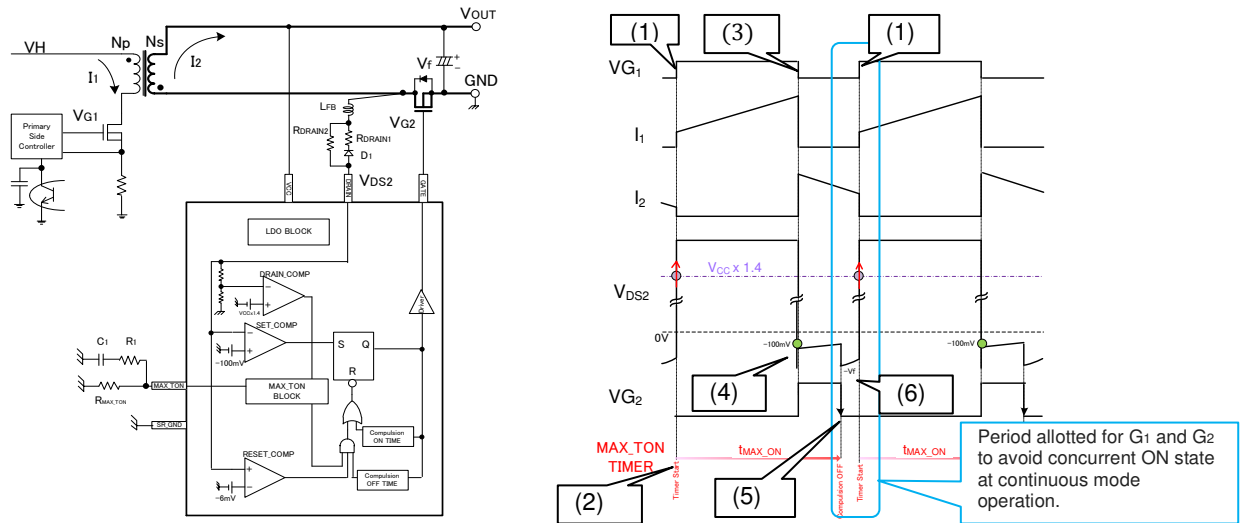

Figure 2. The drive sequence in continuous mode operation

(1) Primary side FET = ON. Current I_1 flows to the primary side FET. Secondary side drain voltage V_{DS2} rises.
(2) The $V_{DS2} = V_{CC} \times 1.4$ detects the rise edge of the threshold, MAX_TON timer start.
(3) Primary side FET = OFF. Current I_2 flows through the Body Diode of the secondary side FET (OFF state).
(4) Secondary side drain voltage $V_{DS2} < -100mV$ by I_2 Current, Secondary side FET=ON.
(5) Elapsed the set time in MAX_TON terminals, the secondary-side FET = compulsory OFF.
(6) Since the I_2 current flows through the Body Diode, V_f voltage occurs.

a capacitor C_1 and a Moreover, in order to reduce as much as possible the influence of the switching noise, resistor R_1 in series should be connected to the MAX_TON terminal. The capacitance should approximately be 1000pF, and the resistance value is recommended to be around 1kΩ.This also serves as phase compensation of MAX_TON terminal and therefore should be connected.

This function may be disabled by pulling up the MAX_TON terminal to VCC pin in quasi-resonant and current resonance applications which do not operate on continuous mode. The 1000pF and 1kΩ resistor is also unnecessary.

6. AUTO SHUTDOWN Block

The Auto Shutdown block automatically turns the synchronous rectification ON/OFF depending on the presence or absence of the DRAIN terminal pulse. Shutdown occurs if the input pulses on the DRAIN terminal has more than 200us between pulses. This stops the synchronous rectification operation. The IC will restart the synchronous rectification after it detects 256 occurrences of input pulses on the DRAIN terminal.

7. SHUNT REGULATOR Chip

A high-accuracy shunt regulator with ultra-low consumption is used for controlling the output voltage of the AC/DC. Since the synchronous rectification and the shunt regulator are built in a completely different chip, GND separation is possible. Therefore, it becomes possible to place the shunt regulator on the secondary-side GND reference in the synchronous rectification applications in case of disposing the High Side FET. It can also be used as protection for the comparator, the secondary side OVP, FET overheat protection, etc.

8. PROTECTION Block

When an abnormal condition is detected after the timer count is completed, the photo coupler from SH_OUT terminal is driven to stop the switching operation on the primary side.

Absolute Maximum Ratings (Ta = 25°C)

Parameter	Symbol	Rating	Unit
VCC Input Voltage	V_{MAX_VCC}	-0.3 to +40[(Note 1)]	V
MAX_TON Input Voltage	$V_{MAX\_MAX\_TON}$	-0.3 to +40[(Note 1)]	V
SH_IN Input Voltage	$V_{MAX\_SH\_IN}$	-0.3 to +40[(Note 2)]	V
SH_OUT Input Voltage	$V_{MAX\_SH\_OUT}$	-0.3 to +40[(Note 2)]	V
Gate Input Voltage	V_{MAX_GATE}	-0.3 to 15.5[(Note 1)]	V
Drain Input Voltage	V_{MAX_DRAIN}	120[(Note 1)(Note 3)]	V
Maximum Junction Temperature	Tjmax	+150	°C
Operating Temperature Range	Topr	-40 to +105	°C
Storage Temperature	Tstr	-55 to +150	°C

(Note 1) Reference SR_GND
(Note 2) Reference SH_GND
(Note 3) When a negative voltage is applied, current flows through the ESD protection device.
This current value is about 6mA or less and will require a current limiting resistor to the DRAIN terminal
Caution: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse in case the IC is operated over the absolute maximum ratings.

Application Examples

Figure 14. Flyback Application Circuit
(Low Side FET)

Figure 15. Flyback Application Circuit
(High Side FET)

Built-in shunt regulator in the IC has been completely separated from internal and synchronous rectification control IC.
Therefore, the shunt regulator is possible to be used as a GND reference in High Side type of flyback application.
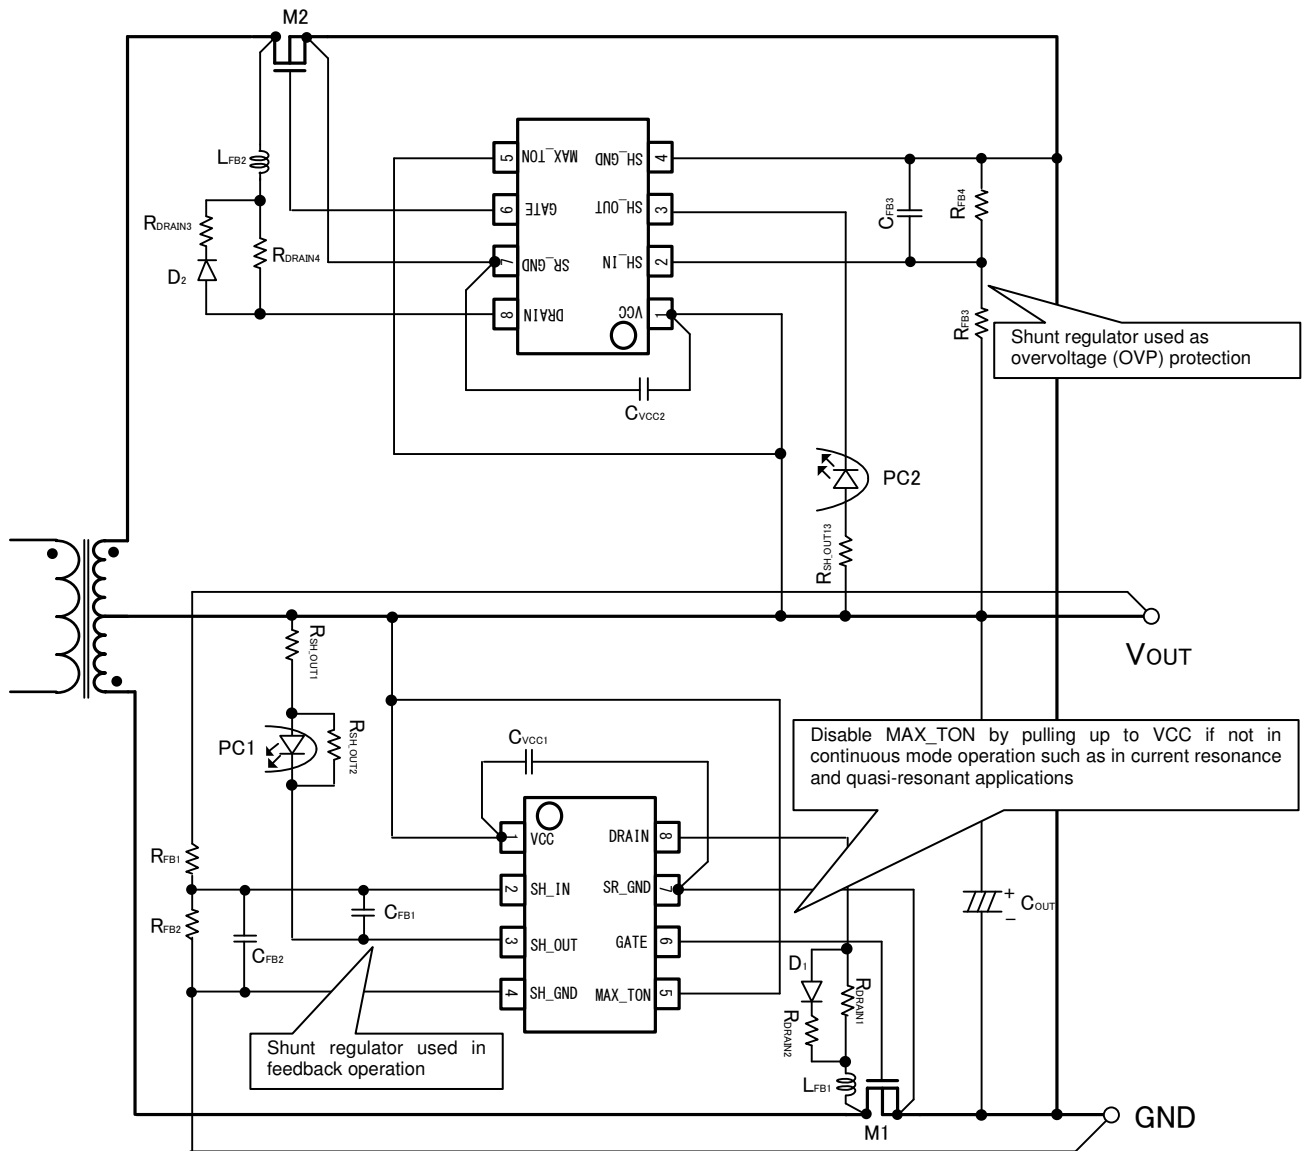

Figure 16. Resonant Half-bridge Application Circuit

Regarding Protection Applications

The built-in shunt regulator is high-voltage, low current consumption, high accuracy, and also suitable as a comparator for protection application. On the above current resonant circuit, the shunt regulator is used as an overvoltage protection circuit.

Selection of Externally Connected Components

1. MAX_TON Pin Setting
    A resistance value which is connected to the MAX_TON terminal is used to set the timer to force the GATE output OFF. (For detailed operation, please see "each block Operation / MAX_TON blocks")
    Set timer is proportional to the resistance value which can be set in the range of 56k to 300k. This IC is capable of an accuracy of 10us ± 6% at 100kΩ. However, accuracy deteriorates as the resistance value gets further away from 100kΩ.
    For example, 5.6μs ±0.9μs at 56kΩ, 30μs ±4.5μs at 300kΩ.
    (See graph below)

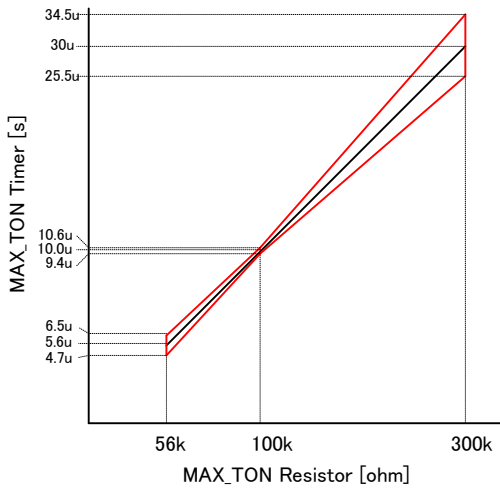

Figure 17. MAX_TON Timer vs MAX_TON Resistor(R_{MAX_TON})

Figure 18. Primary FET and Secondary FET Sequence at CCM Mode

To prevent destruction due to surge current in continuous mode, set the MAX_TON timer before turning on the primary side FET (G_1) to forcibly OFF the secondary side FET (G_2). Regarding such variations, select a resistance value of MAX_TON terminal so that the MAX_ON timer setting time is less than one cycle in the primary side ($T_P > T_{MAX\_ON}$).
- The primary side of the maximum frequency = f_{MAX} [Hz]
- The primary side of the maximum frequency accuracy = Δf_{MAX} [%]
- The primary side of the jitter frequency = f_{JITTER} [Hz]
- Secondary side MAX_TON timer time = t_{MAX_ON}
- Secondary side MAX_TON timer time accuracy = Δt_{MAX_ON}
- Secondary side MAX_TON When the connection resistance accuracy = ΔR

$$R_{MAX\_TON}[k\Omega] < \frac{10000\ [k\Omega][kHz]}{\underbrace{(1+\Delta t_{MAX\_ON}[\%]+\Delta R[\%]+\Delta f_{MAX}[\%])}_{\text{Frequency Variation Ratio}} \times \underbrace{(f_{MAX}[kHz]+f_{JITTER}\ [kHz])}_{\text{Maximum Frequency Value}}}$$

2. Calculation Example
    Primary side frequency 100kHz ± 5%
    Primary side jitter frequency 8kHz
    Secondary side MAX_TON timer accuracy = 7%
    Secondary side MAX_TON connection resistance accuracy = 1%

$$R_{MAX\_TON}\ [k\Omega] < \frac{10000\ [k\Omega][kHz]}{(1+5\%+1\%+7\%)\times(100kHz+8kHz)} = 81.94\ [k\Omega]$$

With these conditions, MAX_TON Resistor(R_{MAX_TON}) should be set to 81kΩ or less. In addition, it is recommended that the temperature characteristics of each component should also be taken into account.

I/O Equivalent Circuits

PIN 1: VCC / PIN 6: GATE / PIN 7: SR_GND	PIN 8: DRAIN

PIN 2: SH_IN / PIN 3: SH_OUT / PIN 4: SH_GND	PIN 5: MAX_TON
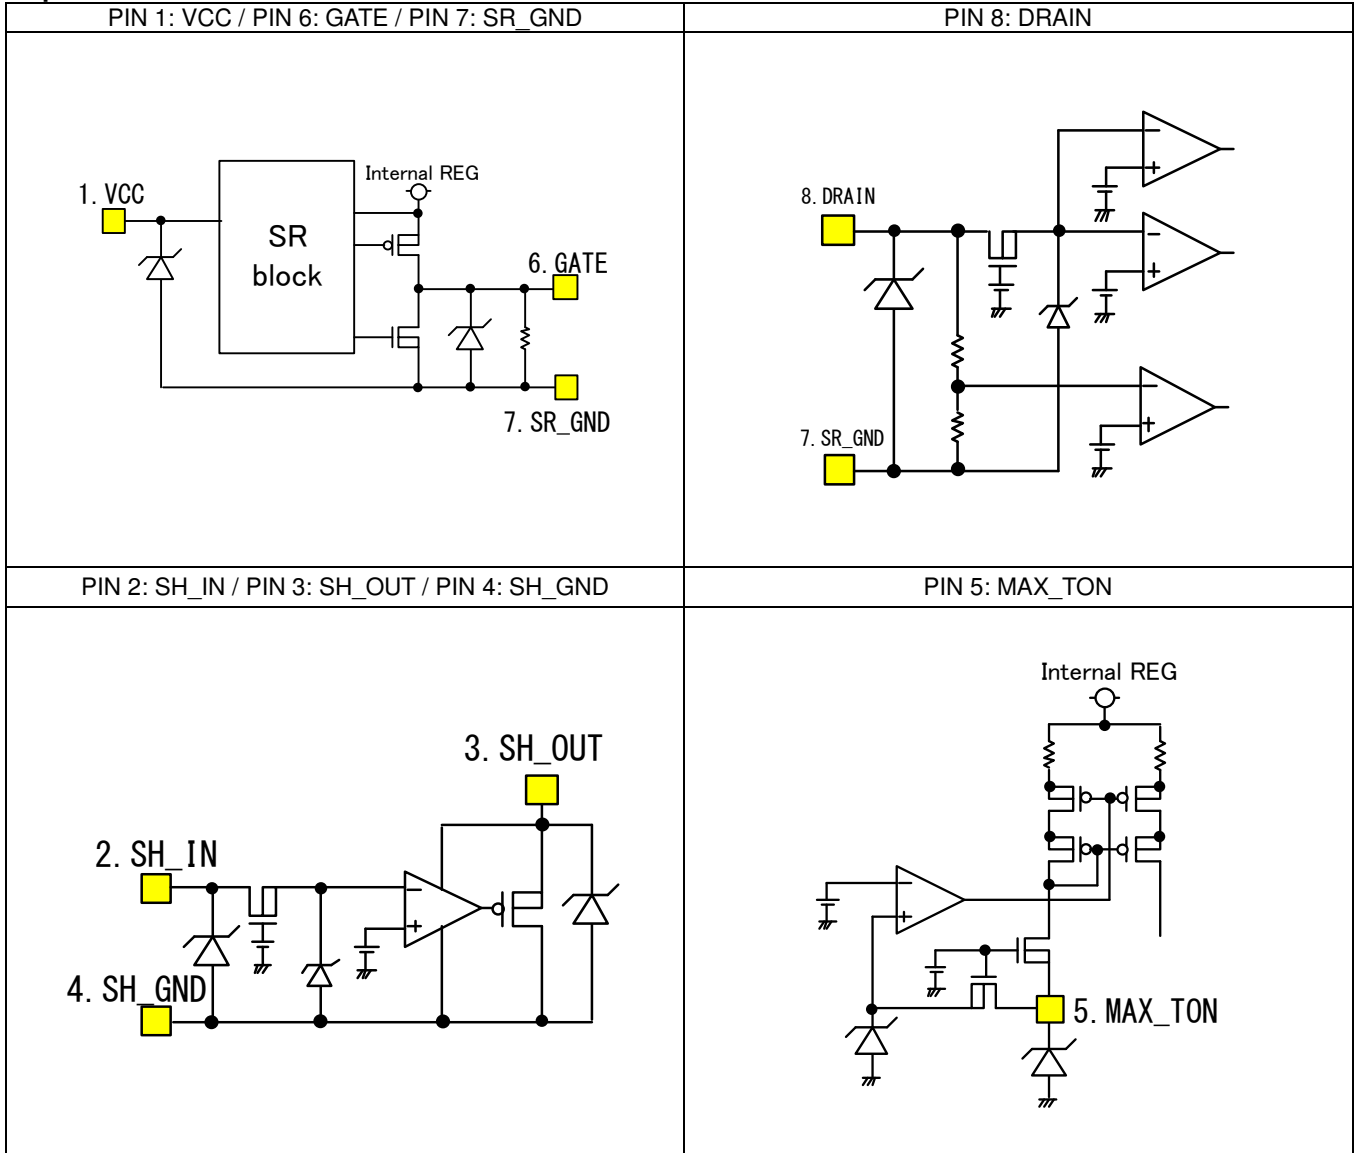

Notes on the layout

Figure 19. Flyback Application Circuit
(Low Side FET)

(1) VCC line may malfunction under the influence of switching noise.
Therefore, it is recommended to insert a capacitor C_{VCC} between the VCC and SR_GND terminal.

(2) SH_IN terminal is a high impedance line. To avoid crosstalk, electrical wiring should be as short as possible and not in parallel with the switching line.

(3) MAX_TON terminal has a 0.4V output. The external components of the MAX_TON terminal affects the forced OFF time due to switching. Thus, R1 and C1 should be connected to MAX_TON terminal as near as possible. It is also recommended to use an independent electrical wiring in connection with SR_GND terminal.

(4) The synchronous rectification controller IC must accurately monitor the V_{DS} generated in the FET. Accordingly, the electrical wiring between the DRAIN to DRAIN and SR_GND to SOURCE of the IC and FET respectively **should be connected independently.**

(5) The SH_GND of the shunt regulator and the feedback resistors of V_{OUT} are recommended to be connected to the GND of the output with an independent electrical wiring.

(6) The DRAIN terminal is a 0↔100V switching line. Use a narrow wiring and connect as short as possible.

(7) Use an independent wiring if connecting a snubber circuit between the DS of the FET. The connection of the transformer output and the SOURCE of the FET should be thick and short as possible.

(8) Due to the DRAIN pin detects the small voltage, a malfunction which the switch turns ON/OFF caused by the surge voltage may occur. So that, the filters such as the ferrite bead are recommended for alleviating the surge voltage.

    Configuration example[Note 6] :
    L_{FB1} (a ferrite bead for suppressing the surge voltage) : MMZ1608S202A
    D_1 (a schottky barrier diode) : RB751G-40
    R_{DRAIN1} (a filter resistor for the FET turn off) : 0.3k - 2kΩ
    R_{DRAIN2} (a current limiting resistor to the DRAIN terminal) : 150Ω

    (Note 6) The value is not a guaranteed value, but for reference. Please choose the optimum values of the components after sufficient evaluations based on the actual application.

Operational Notes

1.   Reverse Connection of Power Supply
Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2.   Power Supply Lines
Design the PCB layout pattern to provide low impedance supply lines. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3.   Ground Voltage
Except for pins the output and the input of which were designed to go below ground, ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4.   Ground Wiring Pattern
When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5.   Thermal Consideration
Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the maximum junction temperature rating.

6.   Recommended Operating Conditions
These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7.   Inrush Current
When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8.   Operation Under Strong Electromagnetic Field
Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9.   Testing on Application Boards
When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

10.   Inter-pin Short and Mounting Errors
Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

11.   Unused Input Terminals
Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

Operational Notes - continued

12. Regarding Input Pins of the IC

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.
When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

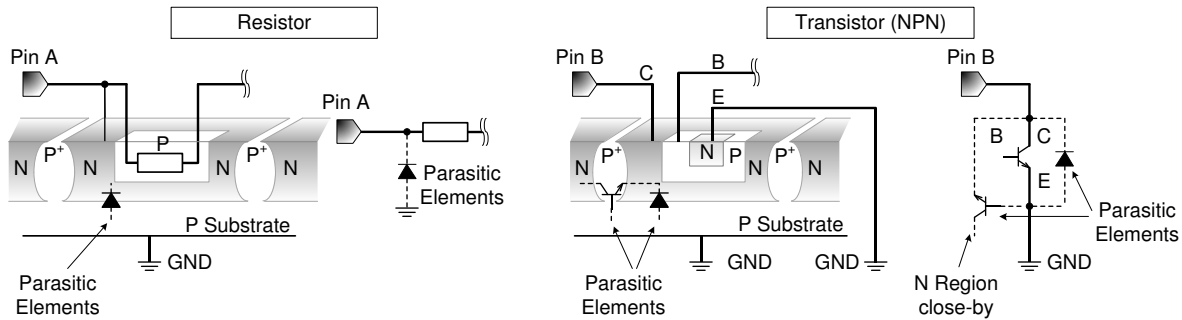

Figure 20. Example of Monolithic IC Structure

13. Ceramic Capacitor

When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

14. Area of Safe Operation (ASO)

Operate the IC such that the output voltage, output current, and the maximum junction temperature rating are all within the Area of Safe Operation (ASO).

15. Thermal Shutdown Circuit(TSD)

BM1R00121F – BM1R00150F (Auto Restart Protection Series)
This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF all output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.
Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

BM1R00001F – BM1R00030F (Latch Protection Series)
This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF all output pins. The IC should be powered down and turned ON again to resume normal operation because the TSD circuit keeps the outputs at the OFF state even if the TJ falls below the TSD threshold.
Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment [(Note 1)], transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASSⅢ	CLASSⅢ	CLASSⅡb	CLASSⅢ
CLASSⅣ		CLASSⅢ	

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
    - [a] Installation of protection circuits or other protective devices to improve system safety
    - [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
    - [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
    - [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
    - [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl_2, H_2S, NH_3, SO_2, and NO_2
    - [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
    - [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
    - [f] Sealing or coating our Products with resin or other coating materials
    - [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
    - [h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Notice-PGA-E **Rev.003**

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
   [b] the temperature or humidity exceeds those recommended by ROHM
   [c] the Products are exposed to direct sunshine or condensation
   [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

Notice-PGA-E **Rev.003**
