

High-side driver with CurrentSense analog feedback for automotive applications

Datasheet - production data

- Protections
 - Undervoltage shutdown
 - Overvoltage clamp
 - Load current limitation
 - Self limiting of fast thermal transients
 - Loss of ground and loss of V_{CC}
 - Reverse battery
 - Electrostatic discharge protection

Features

Max transient supply voltage	V_{CC}	40 V
Operating voltage range	V_{CC}	4 to 28 V
Typ. on-state resistance (per Ch)	R_{ON}	3.5 m Ω
Current limitation (typ)	I_{LIMH}	135 A
Stand-by current (max)	I_{STBY}	0.5 μ A
Minimum cranking supply voltage (V_{CC} decreasing)	$V_{USD_Cranking}$	3 V

- AEC-Q100 qualified
- Extreme low voltage operation for deep cold cranking applications (compliant with LV124, revision 2013)
- General
 - Single channel smart high-side driver with CurrentSense analog feedback
 - Very low standby current
 - Compatible with 3 V and 5 V CMOS outputs
- Diagnostic functions
 - Overload and short to ground (power limitation) indication
 - Thermal shutdown indication
 - OFF-state open-load detection
 - Output short to V_{CC} detection
 - Sense enable/ disable

Applications

Specially intended for Automotive smart power distribution, glow plugs, heating systems, DC motors, relay replacement and high power resistive and inductive actuators.

Description

The device is a single channel high-side driver manufactured using ST proprietary VIPower[®] technology and housed in the Octapak package. The device is designed to drive 12 V automotive grounded loads through a 3 V and 5 V CMOS-compatible interface, providing protection and diagnostics.

The device integrates advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown.

A sense enable pin allows OFF-state diagnosis to be disabled during the module low-power mode as well as external sense resistor sharing among similar devices.

Figure 1: Block diagram

Table 2: Pin functions

Name	Function
V _{CC}	Battery connection.
OUTPUT	Power outputs. all the pins must be connected together.
GND	Ground connection.
INPUT	Voltage controlled input pin with hysteresis. Compatible with 3 V and 5 V CMOS outputs. It controls output switch state.
CS	Analog current sense output pin delivers a current proportional to the load current.
SEn	Active high compatible with 3 V and 5 V CMOS outputs pin; it enables the CurrentSense diagnostic pin.

Figure 2: Configuration diagram (top view)

Table 3: Suggested connections for unused and not connected pins

Connection / pin	CurrentSense	N.C.	Output	Input	SEn
Floating	Not allowed	X ⁽¹⁾	X	X	X
To ground	Through 1 kΩ resistor	X	Not allowed	Through 15 kΩ resistor	Through 15 kΩ resistor

Notes:

⁽¹⁾X: do not care.

2 Electrical specification

Figure 3: Current and voltage conventions

$V_F = V_{OUT} - V_{CC}$ when $V_{OUT} > V_{CC}$ and INPUT = LOW

2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 4: "Absolute maximum ratings"](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

Table 4: Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage	38	V
V_{CCPK}	Maximum transient supply voltage (ISO7637-2:2004 Pulse 5b level IV clamped to 40 V; $R_L = 4\Omega$)	40	
$-V_{CC}$	Reverse DC supply voltage	16	
$-I_{GND}$	DC reverse ground pin current	200	mA
I_{OUT}	OUTPUT DC output current	Internally limited	A
$-I_{OUT}$	Reverse DC output current	38	
I_{IN}	INPUT DC input current	-1 to 10	mA
I_{SEn}	SEn DC input current		
I_{SENSE}	CS pin DC output current ($V_{GND} = V_{CC}$ and $V_{SENSE} < 0$ V)	10	mA
	CS pin DC output current in reverse ($V_{CC} < 0$ V)	-20	
E_{MAX}	Maximum switching energy (single pulse) $T_{DEMAG} = 0.4$ ms; $T_{jstart} = 150^\circ\text{C}$	TBD	mJ

Symbol	Parameter	Value	Unit
V _{ESD}	Electrostatic discharge (JEDEC 22A-114F)	4000	V
	• INPUT	2000	V
	• CurrentSense	4000	V
	• SEn	4000	V
	• OUTPUT	4000	V
	• V _{CC}	4000	V
V _{ESD}	Charge device model (CDM-AEC-Q100-011)	750	V
T _j	Junction operating temperature	-40 to 150	°C
T _{stg}	Storage temperature	-55 to 150	

2.2 Thermal data

Table 5: Thermal data

Symbol	Parameter	Typ. value	Unit
R _{thj-board}	Thermal resistance junction-board ⁽¹⁾	2.1	°C/W
R _{thj-amb}	Thermal resistance junction-ambient (JEDEC JESD 51-5) ⁽²⁾	57.9	
R _{thj-amb}	Thermal resistance junction-ambient (JEDEC JESD 51-7) ⁽¹⁾	15.4	

Notes:

⁽¹⁾Device mounted on four-layers 2s2p PCB

⁽²⁾Device mounted on two-layers 2s0p PCB with 2 cm² heatsink copper trace

2.3 Electrical characteristics

7 V < V_{CC} < 28 V; -40°C < T_j < 150°C, unless otherwise specified.

All typical values refer to V_{CC} = 13 V; T_j = 25 °C, unless otherwise specified.

Table 6: Electrical characteristics during cranking

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V _{USD_Cranksing}	Minimum cranking supply voltage (V _{CC} decreasing)			—	3	V
R _{ON}	On-state resistance	I _{OUT} = 4 A; V _{CC} = 3 V; V _{CC} decreasing		—	15	mΩ
T _{TSD} ⁽¹⁾	Shutdown temperature (V _{CC} decreasing)	V _{CC} = 3 V	140	—		°C

Notes:

⁽¹⁾Parameter guaranteed by design and characterization; not subject to production test.

GADG1107161747SMD

3 Protections

3.1 Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing ΔT_j through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as ΔT_j exceeds the safety level of ΔT_{j_SD} . The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

3.2 Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175°C), it automatically switches off and the diagnostic indication is triggered. The device switches on again as soon as its junction temperature drops to T_R .

3.3 Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level, I_{LIMH} , by operating the output power MOSFET in the active region.

3.4 Negative voltage clamp

In case the device drives inductive load, the output voltage reaches negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value, V_{DEMAG} , allowing the inductor energy to be dissipated without damaging the device.

4 Application information

Figure 28: Application diagram

4.1 Protection against reverse battery

Figure 29: Simplified internal structure

The device does not need any external components to protect the internal logic in case of a reverse battery condition. The protection is provided by internal structures.

In addition, due to the fact that the output MOSFET turns on even in reverse battery mode, thus providing the same low ohmic path as in regular operating conditions, no additional power dissipation has to be considered.

4.2 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the V_{CC} pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 13: "ISO 7637-2 - electrical transient conduction along supply line"](#).

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through V_{CC} and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

Table 13: ISO 7637-2 - electrical transient conduction along supply line

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	$U_s^{(1)}$		min	max	
1	III	-112V	500 pulses	0,5 s		2ms, 10 Ω
2a	III	+55V	500 pulses	0,2 s	5 s	50 μ s, 2 Ω
3a	IV	-220V	1h	90 ms	100 ms	0.1 μ s, 50 Ω
3b	IV	+150V	1h	90 ms	100 ms	0.1 μ s, 50 Ω
4 ⁽²⁾	IV	-7V	1 pulse			100ms, 0.01 Ω
Load dump according to ISO 16750-2:2010						
Test B ⁽³⁾		40V	5 pulse	1 min		400ms, 2 Ω

Notes:

⁽¹⁾ U_s is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

⁽²⁾Test pulse from ISO 7637-2:2004(E).

⁽³⁾With 40 V external suppressor referred to ground ($-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$).

4.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line both to prevent the microcontroller I/O pins from latch-up and to protect the HSD inputs.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation

$$V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -150\text{ V}$; $I_{latchup} \geq 20\text{ mA}$; $V_{OH\mu C} \geq 4.5\text{ V}$

$7.5\text{ k}\Omega \leq R_{prot} \leq 140\text{ k}\Omega$.

Recommended values: $R_{prot} = 15\text{ k}\Omega$

4.4 CS - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (CS) delivering the following signal:

- Current monitor: current monitor of channel output current

Figure 30: CurrentSense and diagnostic – block diagram

4.4.1 Principle of CurrentSense signal generation

Figure 31: CurrentSense block diagram

Current sense

This output is capable of providing:

- Current mirror proportional to the load current in normal operation, delivering current proportional to the load according to known ratio named K
- Diagnostics flag in fault conditions delivering fixed voltage V_{SENSEH}

The current delivered by the current sense circuit, I_{SENSE} , can be easily converted to a voltage V_{SENSE} by using an external sense resistor, R_{SENSE} , allowing continuous load monitoring and abnormal condition detection.

Normal operation (channel ON, no fault, SEn active)

While device is operating in normal conditions (no fault intervention), V_{SENSE} calculation can be done using simple equations

Current provided by CurrentSense output: $I_{SENSE} = I_{OUT}/K$

Voltage on R_{SENSE} : $V_{SENSE} = R_{SENSE} * I_{SENSE} = R_{SENSE} * I_{OUT}/K$

Where :

- V_{SENSE} is voltage measurable on R_{SENSE} resistor
- I_{SENSE} is current provided from CS pin in current output mode
- I_{OUT} is current flowing through output
- K factor represents the ratio between PowerMOS cells and SenseMOS cells; its spread includes geometric factor spread, current sense amplifier offset and process parameters spread of overall circuitry specifying ratio between I_{OUT} and I_{SENSE} .

Failure flag indication

In case of power limitation/overtemperature, the fault is indicated by the CS pin which is switched to a “current limited” voltage source, V_{SENSEH} .

In any case, the current sourced by the CS in this condition is limited to I_{SENSEH}

Figure 32: Analogue HSD – open-load detection in off-state

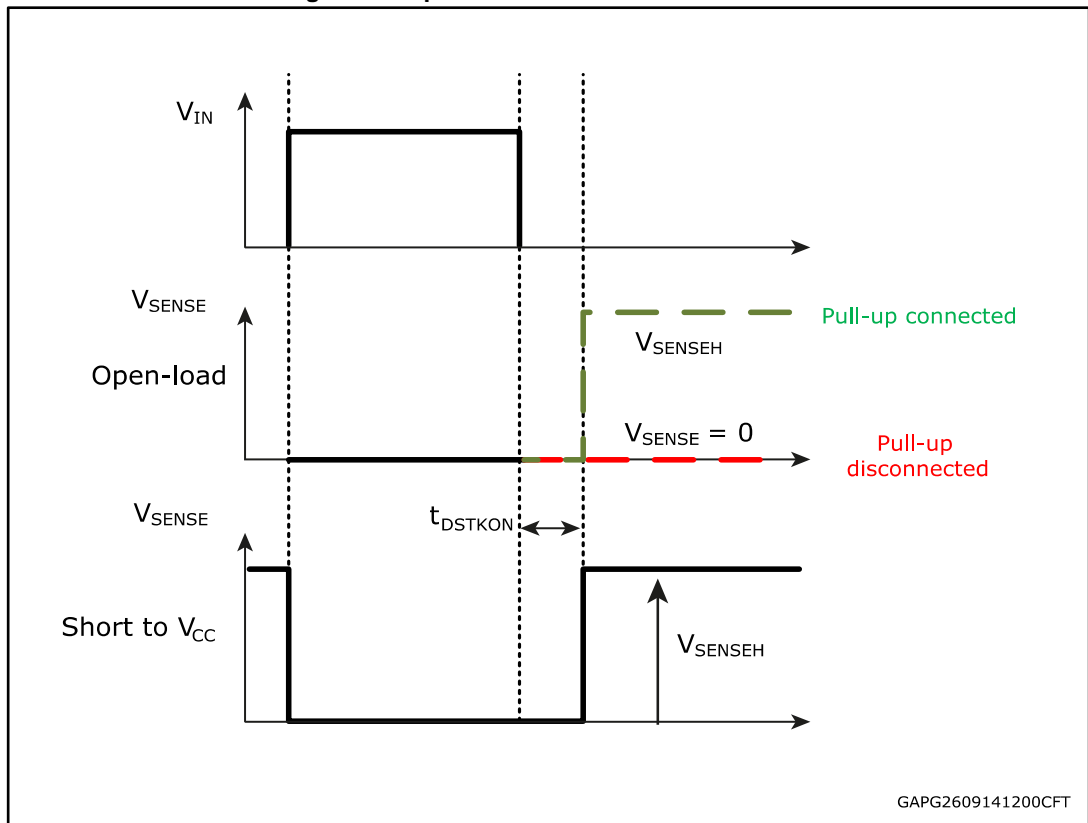

Figure 33: Open-load / short to VCC condition

GAPG2609141200CFT

Table 14: CurrentSense pin levels in off-state

Condition	Output	CurrentSense	SEn
Open-load	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H
Short to V_{CC}	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
Nominal	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H

4.4.2 Short to VCC and OFF-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable V_{PU} to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

R_{PU} must be selected in order to ensure $V_{OUT} > V_{OLmax}$ in accordance with the following equation:

Equation

$$R_{PU} < \frac{V_{PU} - 4}{I_{L(off2)min @ 4V}}$$
