ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

Power and Precision

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

ZMDI[®]
The Analog Mixed Signal Company

Brief Description

The ZSPM4551 is a DC/DC synchronous switching lithium-ion (Li-Ion) battery charger with fully integrated power switches, internal compensation, and full fault protection.

Its switching frequency of 1MHz enables the use of small filter components, resulting in smaller board space and reduced BOM costs.

In Full-Charge Constant-Current Mode, the regulation is for constant current (CC). Once termination voltage is reached, the regulator operates in voltage mode. When the regulator is disabled (the EN pin is low), the device draws 10 μ A (typical) quiescent current.

The ZSPM4551 includes supervisory reporting through the NFLT (inverted fault) open-drain output to interface other components in the system. Device programming is achieved by an I²C™* interface through the SCL and SDA pins.

Benefits

- Up to 1.5A of continuous output current in Full-Charge Constant-Current (CC) Mode
- High efficiency – up to 92% with typical loads

Available Support

- Evaluation Kit
- Support Documentation

Features

- VBAT reverse-current blocking
- Programmable temperature-compensated termination voltage: 3.94V to 4.18V \pm 1%
- User programmable maximum charge current: 50mA to 1500mA
- Current mode PWM control in constant voltage
- Supervisor for VBAT reported at the NFLT pin
- Input supply under-voltage lockout
- Full protection for over-current, over-temperature, VBAT over-voltage, and charging timeout
- Charge status indication
- I²C™ program interface with EEPROM registers

Related ZMDI Smart Power Products

- ZSPM4121 Ultra-low Power Under-Voltage Switch
- ZSPM4141 Ultra-Low-Power Linear Regulator

Physical Characteristics

- Wide input voltage range: V_{BAT} + 0.3V (3.5V min.) to 7.2V
- Junction operating temperature: -40°C to 125°C
- Package: 16-pin PQFN (4mm x 4mm)

ZSPM4551 Application Circuit

* I²C™ is a trademark of NXP.

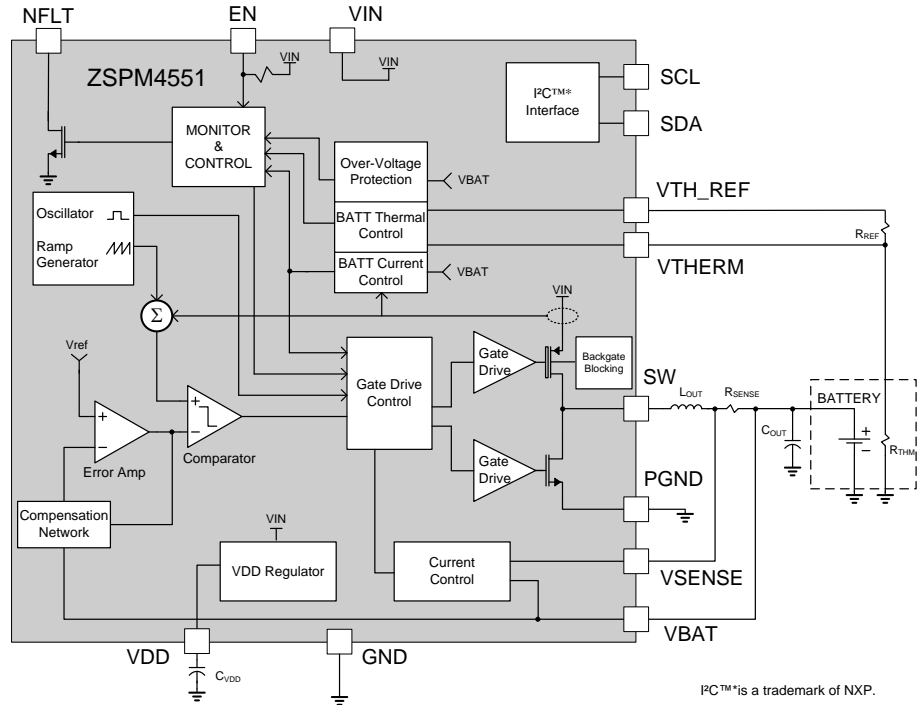

For more information, contact ZMDI via Analog@zmdi.com.

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

ZSPM4551 Block Diagram

Typical Applications

- Portable battery chargers
- Smart phones
- Laptops
- Tablets/e-readers

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

ZMDI[®]

The Analog Mixed Signal Company

1 ZSPM4551 Characteristics

Important: Stresses beyond those listed under “Absolute Maximum Ratings” (section 1.1) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “Recommended Operating Conditions” is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

1.1. Absolute Maximum Ratings

Over operating free–air temperature range unless otherwise noted.

Table 1.1 Absolute Maximum Ratings

| Parameter | Value ¹⁾ | Unit |
|--|---------------------|------|
| VIN, EN, NFLT, SCL, SDA, VTHERM, VTH_REF, VBAT, VSENSE | -0.3 to 8 | V |
| SW | -1 to 8.8 | V |
| VDD | -0.3 to 3.6 | V |
| Operating Junction Temperature Range, T _J | -40 to 125 | °C |
| Storage Temperature Range, T _{STOR} | -65 to 150 | °C |
| Electrostatic Discharge – Human Body Model ²⁾ | ±2k | V |
| Electrostatic Discharge – Machine Model ²⁾ | +/-200 | V |
| Lead Temperature (soldering, 10 seconds) | 260 | °C |

1) All voltage values are with respect to network ground terminal.
2) ESD testing is performed according to the respective JEDEC standard.

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

1.2. Thermal Characteristics

Table 1.2 Thermal Characteristics

| Parameter | Symbol | Value ¹⁾ | Unit |
|---|---------------|---------------------|------|
| Thermal Resistance Junction to Air ¹⁾ | θ_{JA} | 50 | °C/W |
| 1) Assumes a 4x4mm QFN-16 in 1 in ² area of 2 oz. copper and 25°C ambient temperature. | | | |

1.3. Recommended Operating Conditions

Table 1.3 Recommended Operating Conditions

| Parameter | Symbol | Min | Typ | Max | Unit |
|---|---------------|--------------------------------|-----|-----|------|
| Input Operating Voltage at VIN Pin | V_{IN} | $V_{BAT} + 0.3V$ (3.5V min) | 5.3 | 7.2 | V |
| Sense Resistor | R_{SENSE} | | 50 | | mΩ |
| Output Filter Inductor Typical Value ¹⁾ | L_{OUT} | | 4.7 | | μH |
| Output Filter Capacitor Typical Value ²⁾ | C_{OUT} | | 4.7 | | μF |
| Output Filter Capacitor ESR | $C_{OUT-ESR}$ | | | 100 | mΩ |
| Input Supply Bypass Capacitor Value ³⁾ | C_{IN} | 3.3 | 10 | | μF |
| VDD Supply Bypass Capacitor Value ²⁾ | C_{VDD} | 70 | 100 | 130 | nF |
| Operating Free Air Temperature | T_A | -40 | | 85 | °C |
| Operating Junction Temperature | T_J | -40 | | 125 | °C |
| 1) For best performance, use an inductor with a saturation current rating higher than the maximum V_{BAT} load requirement plus the inductor current ripple. | | | | | |
| 2) For best performance, use a low ESR ceramic capacitor. | | | | | |
| 3) For best performance, use a low ESR ceramic capacitor. If C_{IN} is not a low ESR ceramic capacitor, add a 0.1μF ceramic capacitor in parallel to C_{IN} . | | | | | |

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

1.4. Electrical Characteristics

Electrical characteristics $T_J = -40^{\circ}\text{C}$ to 125°C , $V_{IN} = 5.3\text{V}$, (unless otherwise noted)

Table 1.4 Electrical Characteristics

1) The I²C™ interface will operate in either standard or fast mode.
2) Parameter not tested in production.

ZSPM4551

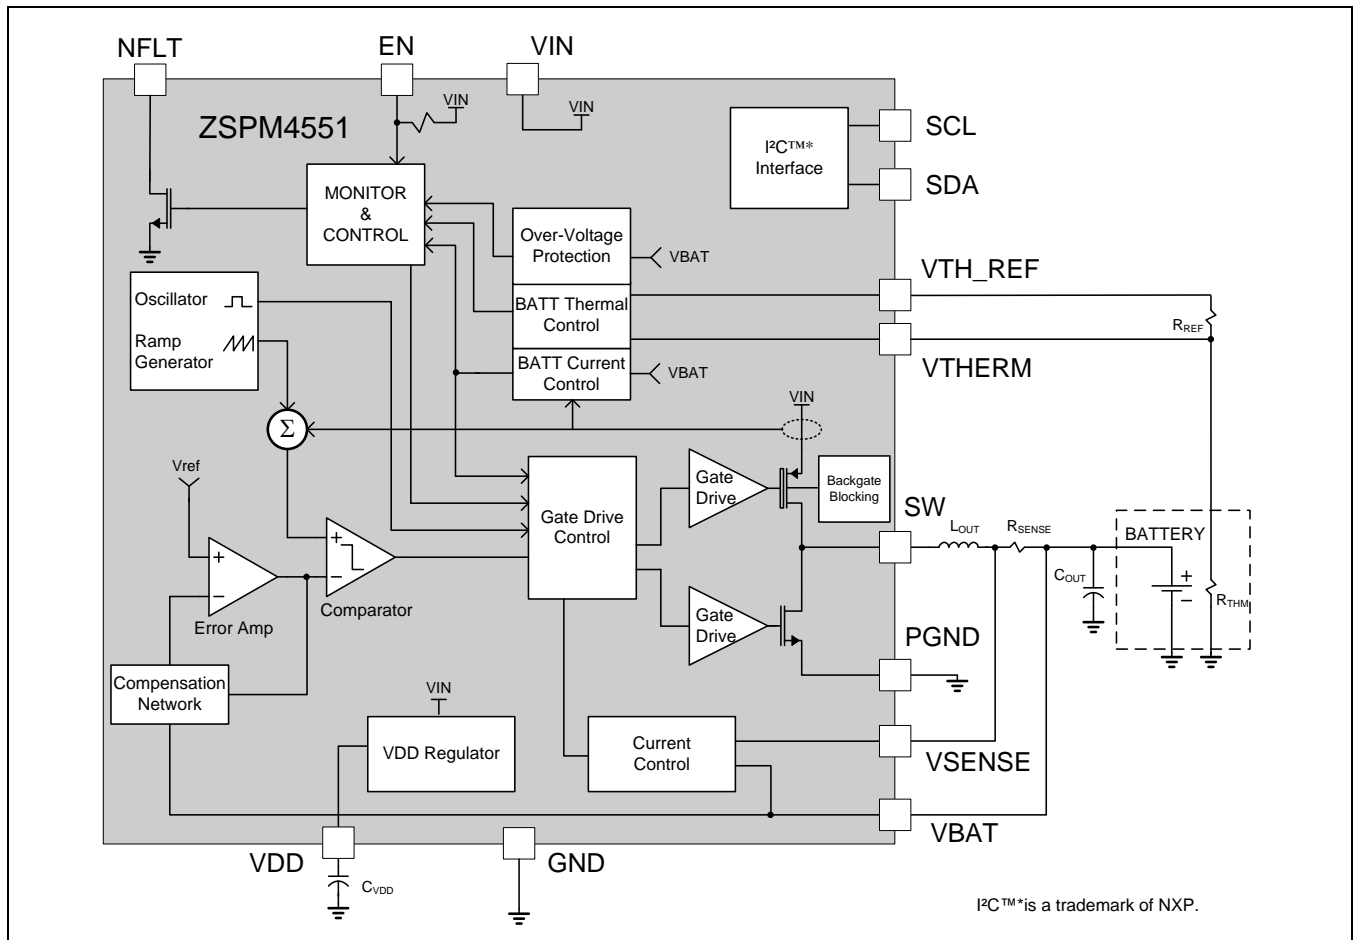

High-Efficiency Charger for Li-Ion Batteries

2 Functional Description

The ZSPM4551 is a fully-integrated Li-Ion battery charger IC based on a highly-efficient switching topology. It is configurable for termination voltage, charge current, and additional variables to allow optimum charging conditions for a wide range of Li-Ion batteries. A 1MHz internal switching frequency facilitates low-cost LC filter combinations. Figure 2.1 provides a block diagram for the ZSPM4551.

Figure 2.1 ZSPM4551 Block Diagram

When the battery voltage is below 3.0 volts, the ZSPM4551 enters a pre-charge state and applies a small, programmable charge current to safely charge the battery to a level for which full-charge current can be applied. Once the Full-Charge Mode has been initiated, the regulation will be for constant current (CC). When the battery voltage has increased enough to go into maintenance mode, the PWM control loop will force a constant voltage across the battery. Once in constant voltage mode, current is monitored to determine when the battery is fully charged. See Figure 2.2 for a diagram of the charging states.

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

This regulation voltage as well as the 1C charging current can be set to change based on the battery temperature. There are four temperature ranges for which the regulation voltage can be set independently: 0°C to 10°C, 10°C to 45°C, 45°C to 50°C, and 50°C to 60°C. The ZSPM4551 will stop charging if the temperature passes the descending temperature threshold at 0°C or the ascending threshold at 60°C. These thresholds have 10 degrees of hysteresis. The intermediate points have 1 degree of hysteresis.

2.1. Internal Protection

2.1.1. VIN Under-Voltage Lockout

The device is held in the off state until the EN pin voltage is HIGH ($\geq 2.2V$) and VIN rises to 3.15V (typical). There is a 200mV hysteresis on this input, which requires the input to fall below 2.95V (typical) before the device will disable.

2.1.2. Internal Current Limit

The current through the inductor L_{OUT} is sensed on a cycle-by-cycle basis and if the current limit (I_{OCD} ; see section 1.4) is reached, the ZSPM4551 will abbreviate the cycle. The current limit is always active when the regulator is enabled.

2.1.3. Thermal Shutdown

If the junction temperature of the ZSPM4551 exceeds 170°C (typical), the SW output will tri-state to protect the device from damage. The NFLT and all other protection circuitry will stay active to inform the system of the failure mode. Once the device cools to 160°C (typical), the device will attempt to start up again. If the device reaches 170°C, the shutdown/restart sequence will repeat.

2.1.4. VBAT Over-Voltage Protection

The ZSPM4551 has a battery protection circuit designed to shut down the charging profile if the battery voltage is greater than the termination voltage. The termination voltage can change based on user programming, so the protection threshold is set to 2% above the termination voltage. Shutting down the charging profile puts the ZSPM4551 in a fault condition.

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

2.2. Fault Handling

2.2.1. NFLT Pin Functionality

In the event of a battery over-voltage, the battery temperature being outside of the safe charging range, or the full charge timer expiring, charging stops, and the NFLT pin is pulled low. When the fault condition is no longer present, the device will enter the INITIALIZE state (see Figure 2.2), but the NFLT pin will remain low until the STATUS register (00_{HEX}) is read (see Table 2.2). When the STATUS register is read, the NFLT pin will go high until a new fault is detected.

2.2.2. Other Faults

When an open thermistor, thermal shut down, VIN under-voltage, or top-off time-out are detected, charging immediately stops and the corresponding bit in the STATUS register (00_{HEX}) is set. The device enters the INITIALIZE state until the fault is no longer detected.

2.3. Serial Interface

The ZSPM4551 features an I²C™ slave interface that offers advanced control and diagnostic features. It supports standard and fast mode data rates and auto-sequencing, and it is compliant to I²C™ standard version 3.0.

I²C™ operation offers configuration control for termination voltages, charge currents, and charge timeouts. This configurability allows optimum charging conditions in a wide range of Li-Ion batteries. I²C™ operation also offers fault and warning indicators. Whenever a fault is detected, the associated status bit in the STATUS register is set and the NFLT pin is pulled low. Whenever a warning is detected, the associated status bit in the STATUS register is set, but the NFLT pin is not pulled low. Reading the STATUS register resets the fault and warning status bits, and the NFLT pin is released after all fault status bits have been reset.

2.3.1. I²C™ Subaddress Definition

Figure 2.3 Subaddress in I²C™ Transmission

2.3.2. I²C™ Bus Operation

The ZSPM4551's I²C™ is a two-wire serial interface; the two lines are serial clock (SCL) and serial data (SDA) (see Figure 2.4). SDA must be connected to a positive supply (e.g., the VDD pin) through an external pull-up resistor. The devices communicating on this bus can drive the SDA line low or release it to high impedance. To ensure proper operation, setup and hold times must be met (see Table 1.5). The device that initiates the I²C™ transaction becomes the master of the bus.

Communication is initiated by the master sending a START condition, which is a high-to-low transition on SDA while the SCL line is high. After the START condition, the device address byte is sent, most significant bit (MSB) first, including the data direction bit (read = 1; write = 0). After receiving the valid address byte, the device responds with an acknowledge (ACK). An ACK is a low on SDA during the high of the ACK-related clock pulse. On the I²C™ bus, during each clock pulse, only one data bit is transferred. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as START or STOP control conditions. A low-to-high transition on SDA while the SCL input is high indicates a STOP condition and is sent by the master.

2.4. Status and Configuration Registers

Table 2.1 Register Descriptions (Device Address = 48_{HEX})

| Register | Address | Name | Default | Description |
|----------|-------------------|---------------------------|-------------------|--------------------------------------|
| 0 | 00 _{HEX} | STATUS | 00 _{HEX} | Status bit register |
| 1 | N/A | N/A | N/A | Register not implemented |
| 2 | 02 _{HEX} | CONFIG1 ¹⁾ | EEPROM | Configuration register |
| 3 | 03 _{HEX} | CONFIG2 ¹⁾ | EEPROM | Configuration register |
| 4 | 04 _{HEX} | CONFIG3 ¹⁾ | EEPROM | Configuration register |
| 5 | 05 _{HEX} | CONFIG4 ¹⁾ | EEPROM | Configuration register |
| 6 | 06 _{HEX} | CONFIG5 ¹⁾ | EEPROM | Configuration register |
| 7-16 | N/A | N/A | N/A | Registers not implemented |
| 17 | 11 _{HEX} | CONFIG_ENABLE | 00 _{HEX} | Enable configuration register access |
| 18 | 12 _{HEX} | EEPROM_CTRL ¹⁾ | 00 _{HEX} | EEPROM control register |

1) CONFIG_x and EEPROM_CTRL registers are only accessible when the CONFIG_ENABLE register is written with the EN_CFG bit set to 1 (see Table 2.8).

Table 2.2 STATUS Register—Address 00_{HEX}

Note: All of the STATUS register bits are READ-only.

| DATA BIT | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|------------|--|-------|---------|----------|-----|--------|--------|---------|
| FIELD NAME | BATT_OV | 1C_TO | TEMP_0C | TEMP_60C | TSD | TOP_TO | VIN_UV | TH_OPEN |
| FIELD NAME | BIT DEFINITION ¹⁾ | | | | | | | |
| BATT_OV | VBAT over-voltage. | | | | | | | |
| 1C_TO | Full charge timer has timed out. | | | | | | | |
| TEMP_0C | Thermistor indicates battery temperature < 0°C. | | | | | | | |
| TEMP_60C | Thermistor indicates battery temperature > 60°C. | | | | | | | |
| TSD | Thermal shutdown. | | | | | | | |
| TOP_TO | Top-off timer has timed out. | | | | | | | |
| VIN_UV | VIN under-voltage. | | | | | | | |
| TH_OPEN | Thermistor open (battery not present). | | | | | | | |

1) Faults are defined as BATT_OV, 1C_TO, TEMP_0C, and TEMP_60C. Warnings are defined as TSD, TOP_TO, VIN_UV, and TH_OPEN. Faults cause the NFLT pin to be pulled low. Warnings do not cause the NFLT pin to be pulled low. All status bits are cleared after STATUS register read access. The NFLT pin will go to high impedance (open-drain output) after the STATUS register has been read and all status bits have been reset.

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

3 Application Circuits

3.1. Typical Application Circuit

Figure 3.1 Typical Application Circuit for Charging a Lithium-Ion Battery

3.2. Selection of External Components

Note that the internal compensation is optimized for a 4.7 μ F output capacitor (C_{OUT}) and a 4.7 μ H output inductor (L_{OUT}). Table 1.3 provides recommended ranges for most of the following components.

3.2.1. C_{OUT} Output Capacitor

To keep the output ripple low, a low ESR (less than 35m Ω) ceramic capacitor is recommended for the 4.7 μ F output filter capacitor. The ESR should not exceed 100m Ω .

3.2.2. L_{OUT} Output Inductor

For best performance, an inductor with a saturation current rating higher than the maximum V_{OUT} load requirement plus the inductor current ripple should be used for the 4.7 μ H output filter inductor.

3.2.3. C_{IN} Bypass Capacitor

For best performance, a low ESR ceramic capacitor should be used for the 10 μ F input supply bypass capacitor. If it is not a low ESR ceramic capacitor, a 0.1 μ F ceramic capacitor should be added in parallel to C_{IN} .

3.2.4. C_{VDD} Bypass Capacitor for VDD Internal Reference Voltage Output

For best performance, a low ESR ceramic capacitor should be used for the 100nF bypass capacitor from the VDD pin to ground.

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

ZMDI[®]

The Analog Mixed Signal Company

3.2.5. R_{SENSE} Output Sensing Resistor

The typical value for the output sensing resistor is 50mΩ.

3.2.6. Pull-up Resistors

For proper function of the I²C™ interface, the SDA pin must be connected to a positive supply (e.g., the VDD pin) through an external pull-up resistor.

For proper function of the fault warning signal on the NFLT pin, it must be connected to a positive supply (VDD) through an external pull-up resistor.

4 Pin Configuration and Package

4.1. ZSPM4551 Package Dimensions

Figure 4.1 PQFN-16 Package Dimensions

4.3. Pin Description for 16-Pin PQFN (4 x 4 mm)

Table 4.1 Pin Description

| Pin # | Name | Function | Description |
|-------|--------|---------------------------------------|--|
| 1 | SW | Switching Voltage Node | Connect to 4.7µH (typical) inductor L _{OUT} . Also connect to additional SW pin 14. |
| 2 | VIN | Input Voltage | Input voltage. Also connect to C _{IN} . Also connect to additional VIN pin 11. |
| 3 | VSENSE | Current Sense Positive Input | Positive input for the current loop. |
| 4 | VBAT | Output Voltage | Regulator feedback input. |
| 5 | GND | GND | Primary ground for the majority of the device except the low-side power FET. |
| 6 | EN | Enable Input | When EN is high ($\geq 2.2V$), the device is enabled. Ground the pin to disable the device. Includes internal pull-up. |
| 7 | NFLT | Inverted Fault | Open-drain output. |
| 8 | VDD | Internal 3.3V Supply Output | Connect to a 100nF capacitor to GND. |
| 9 | VTHERM | Battery Temperature Sensor Minus Node | Negative node for the thermistor, which must be located in close proximity to the battery. |

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

ZMDI[®]

The Analog Mixed Signal Company

| Pin # | Name | Function | Description |
|-------|---------|--|--|
| 10 | VTH_REF | Battery Temperature Sensor Positive Node | Positive node for the thermistor, which must be located in close proximity to the battery. |
| 11 | VIN | Input Voltage | Additional VIN pin for input voltage; connect to VIN pin 2. |
| 12 | SCL | Clock Input | I ² C™ clock input. |
| 13 | SDA | Data Input/Output | I ² C™ data (open-drain output). |
| 14 | SW | Switching Voltage Node | Additional SW pin; connect to SW pin 1. |
| 15 | PGND | Power GND | GND supply for internal low-side FET/integrated diode. Also connect to additional PGND pin 16. |
| 16 | PGND | Power GND | GND supply for internal low-side FET/integrated diode. Also connect to additional PGND pin 15. |

5 Layout Recommendations

To maximize the efficiency of this package for application on a single layer or multi-layer PCB, certain guidelines must be followed when laying out this part on the PCB.

5.1. Multi-Layer PCB Layout

The following are guidelines for mounting the exposed pad ZSPM4551 on a multi-layer PCB with ground a plane. In a multi-layer board application, the thermal vias are the primary method of heat transfer from the package thermal pad to the internal ground plane. The efficiency of this method depends on several factors, including die area, number of thermal vias, and thickness of copper, etc.

Figure 5.1 Package and PCB Land Configuration for Multi-Layer PCB

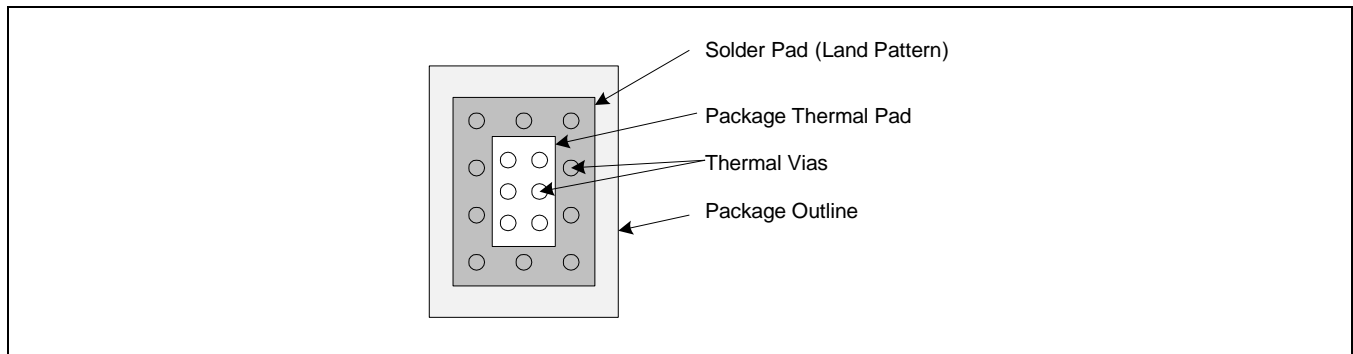

Figure 5.2 JEDEC Standard FR4 Multi-Layer Board – Cross-Sectional View

Figure 5.3 is a representation of how the heat can be conducted away from the die using an exposed pad package. Each application will have different requirements and limitations, and therefore the user should use sufficient copper to dissipate the power in the system. The output current rating for the linear regulators might need to be de-rated for ambient temperatures above 85°C. The de-rated value will depend on calculated worst case power dissipation and the thermal management implementation in the application.

Figure 5.3 Conducting Heat Away from the Die using an Exposed Pad Package

5.2. Single-Layer PCB Layout

Layout recommendations for a single-layer PCB: Utilize as much copper area for power management as possible. In a single-layer board application, the thermal pad is attached to a heat spreader (copper areas) by using a low thermal impedance attachment method (solder paste or thermal conductive epoxy).

In both of the methods mentioned above, it is advisable to use as much copper trace as possible to dissipate the heat.

ZSPM4551

High-Efficiency Charger for Li-Ion Batteries

ZMDI®

The Analog Mixed Signal Company

Figure 5.4 Application Using a Single-Layer PCB

Important: If the attachment method is NOT implemented correctly, the functionality of the product is NOT guaranteed. Power dissipation capability will be adversely affected if the device is incorrectly mounted onto the circuit board.
